# Dusty AGB winds as seen by PACS & SPIRE spectroscopy

**D. Nicolaes<sup>(1,2)</sup>**

**M.A.T. Groenewegen<sup>(1)</sup>, L. Decin<sup>(2)</sup>, P. Royer<sup>(2)</sup>, R. Lombaert<sup>(2,3)</sup>**

<sup>(1)</sup>Royal Observatory of Belgium / <sup>(2)</sup>KU Leuven / <sup>(3)</sup>Onsala Space Observatory

# 1. Context: mass loss ingredients and stellar parameters

Figure from Katrien Kolenberg

# 1. Context: mass loss ingredients and stellar parameters

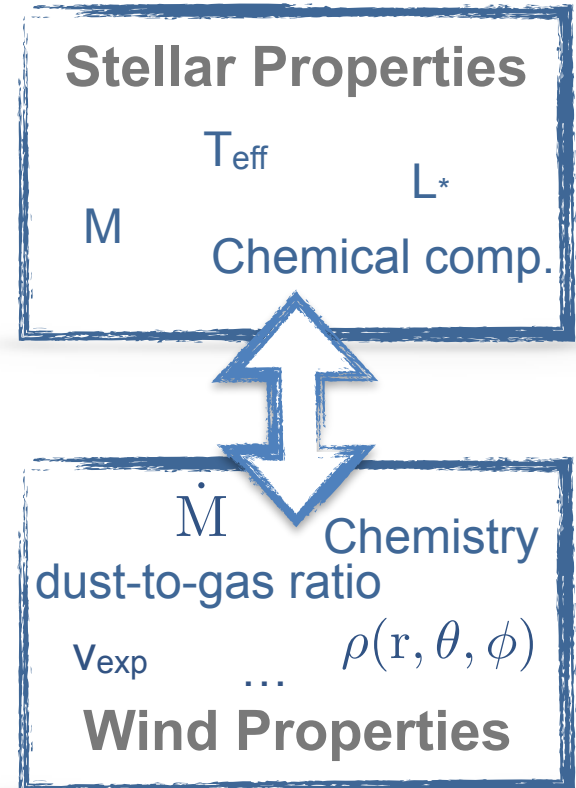

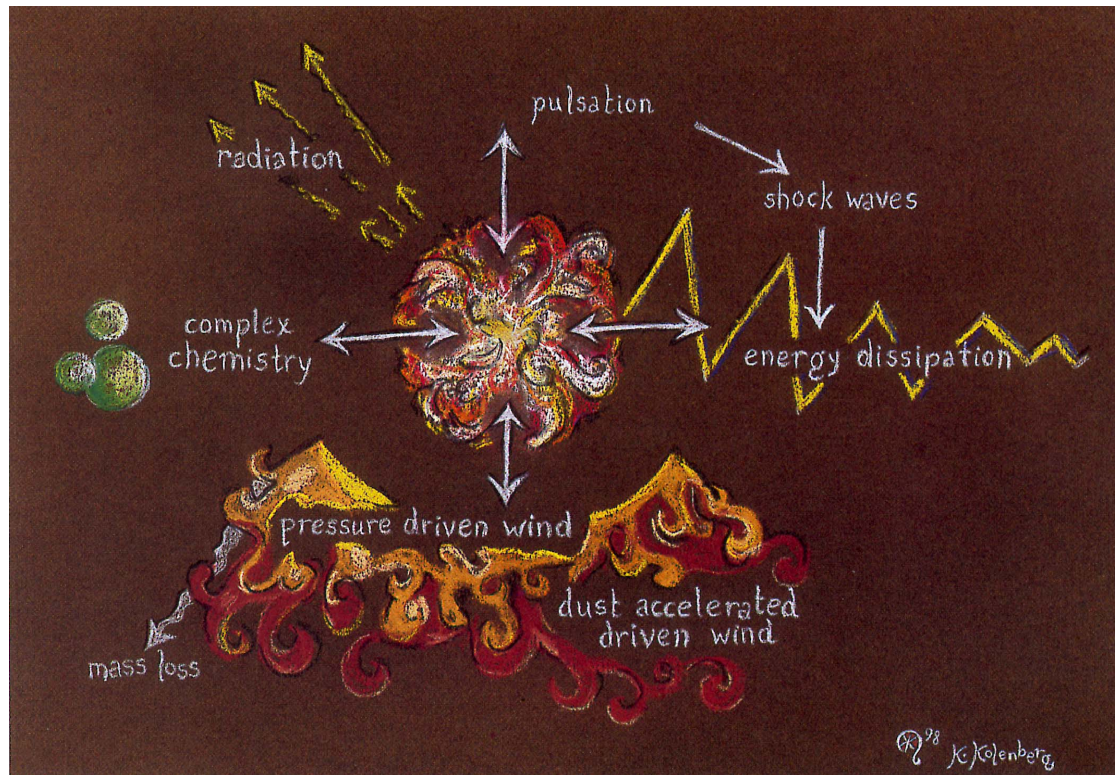

Figure from Katrien Kolenberg

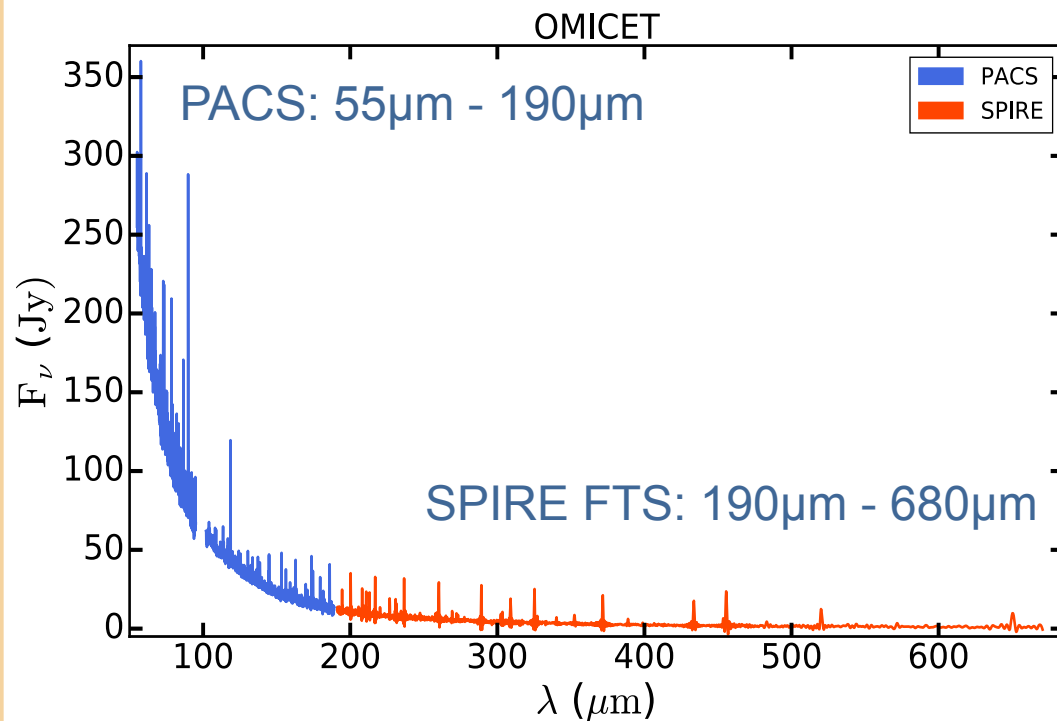

# 1. Context: mass loss ingredients and stellar parameters

## 2. PACS & SPIRE spectroscopy: exploitation of the continuum

### Stronger constraints on

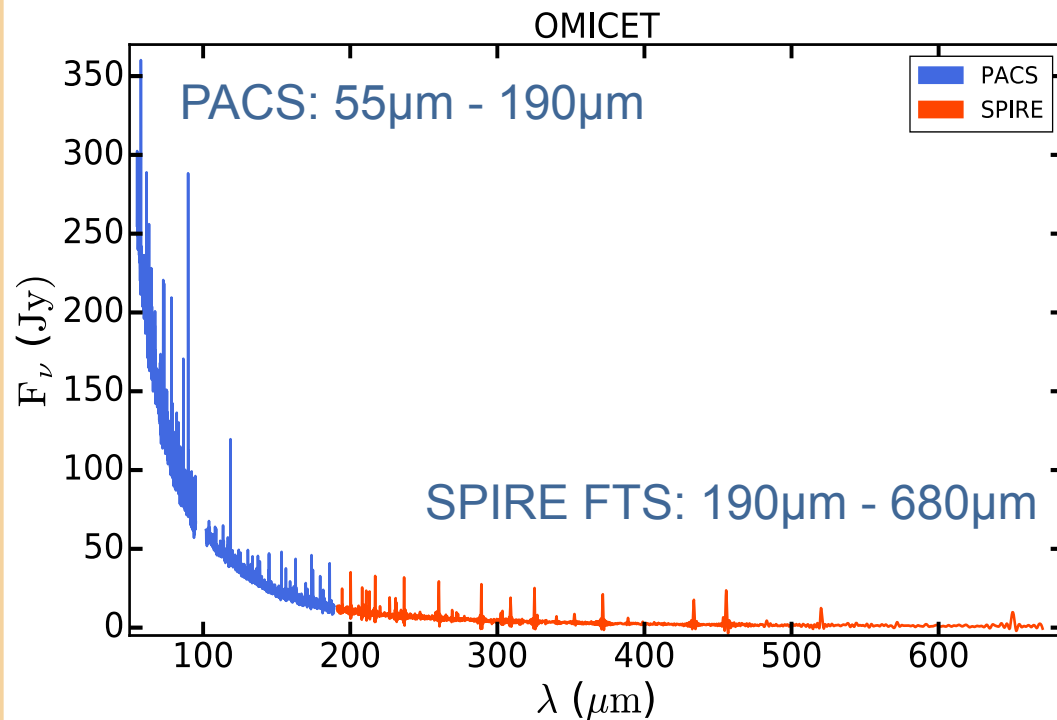

#### dust properties:

- chemical composition
- size
- shape
- ...

#### dust density distribution:

- complicated variants (variable mass loss, multiple shells)

## 2. PACS & SPIRE spectroscopy: exploitation of the continuum

### Stronger constraints on

#### dust properties:

- chemical composition
- size
- shape
- ...

#### dust density distribution:

- complicated variants (variable mass loss, multiple shells)

### Sample study of AGB targets

- different evolutionary states and stellar properties
- global, statistical view on wind vs stellar properties

## 2. PACS & SPIRE spectroscopy: a unique sample

**MESS (Mass Loss of Evolved StarS)** GTK programme; *PI Groenewegen*:

PACS: 25

SPIRE: 11

+ photometric maps

GT programme; *PI Barlow*:

SPIRE: 8

OT programme; *PI Jusstanont*:

PACS: 6

SPIRE: 7

+ HiGAL programme; *PI Noriega-Crespo*: PACS and SPIRE parallel mode photometry

OT programme; *PI Cami*:

PACS: 2

Filler programme:

PACS: 5

SPIRE: 1

## 2. PACS & SPIRE spectroscopy: a unique sample

**MESS (Mass Loss of Evolved StarS)** GTK programme; *PI Groenewegen*:

OT programme; *PI Cami*:

PACS: 2

Filler programme:

PACS: 5

SPIRE: 1

**26 M-type (6 OH/IR)**

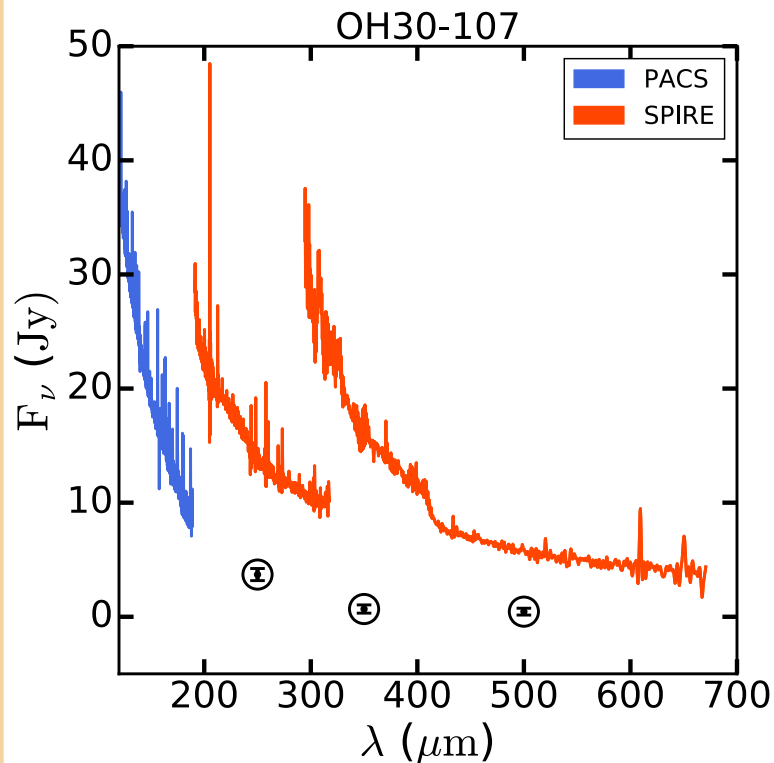

**9 C-type**

**3 S-type**

**Total: 38**

### 3. Data post-processing: background removal

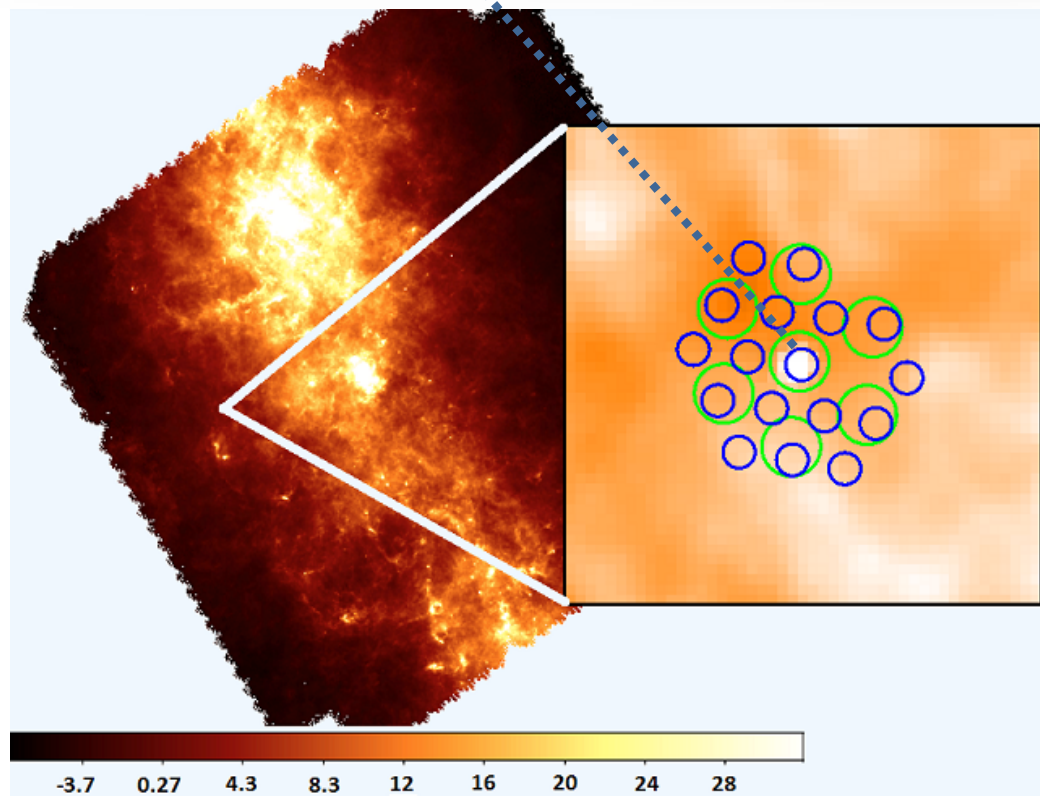

Affected SPIRE spectra of targets with bright, extended background; e.g. OH/IR sources in galactic plane.

### 3. Data post-processing: background removal

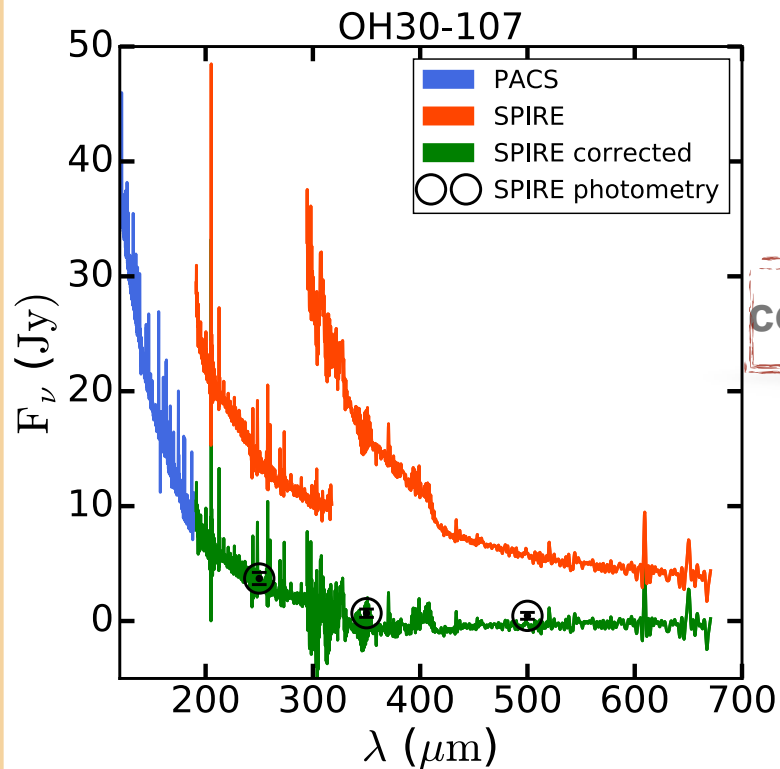

Affected SPIRE spectra of targets with bright, extended background; e.g. OH/IR sources in galactic plane.

$$\text{corrected} = \text{central on-source} - \text{mean}(\text{off-source})$$

### 3. Data post-processing: background removal

Affected SPIRE spectra of targets with bright, extended background; e.g. OH/IR sources in galactic plane.

**corrected = central on-source - mean(off-source)**

### 3. Data post-processing: molecular line clipping

#### Molecular lines:

- trace intermediate and outer gaseous envelope
- cumbersome for dust continuum analysis

### 3. Data post-processing: molecular line clipping

#### Molecular lines:

- trace intermediate and outer gaseous envelope
- cumbersome for dust continuum analysis

#### Unresolved lines

- fitting gaussian instrumental profile
- line strengths & gaussian fit parameters

#### Subtracting lines from spectrum

### 3. Data post-processing: molecular line clipping

#### Molecular lines:

- trace intermediate and outer gaseous envelope
- cumbersome for dust continuum analysis

#### Unresolved lines

- Fitting gaussian instrumental profile
- line strengths & gaussian fit parameters

#### Subtracting lines from spectrum

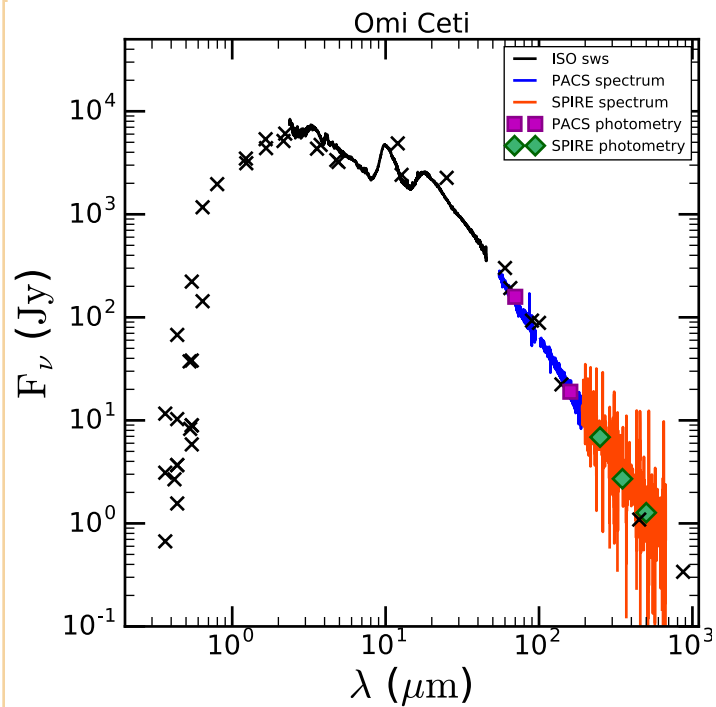

# 4. Radiative Transfer Modeling

## SED:

- photometry (UV - radio)
- ISO SWS
- PACS & SPIRE

# 4. Radiative Transfer Modeling

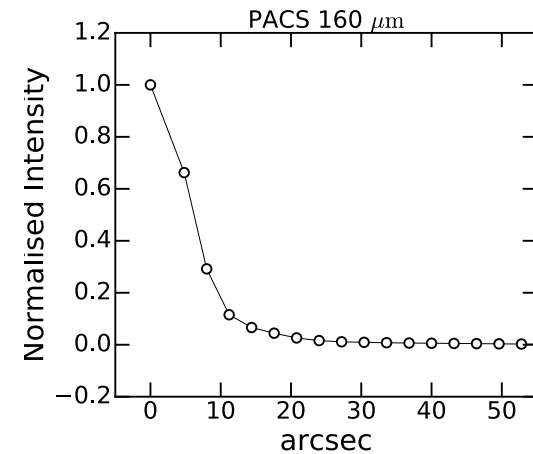

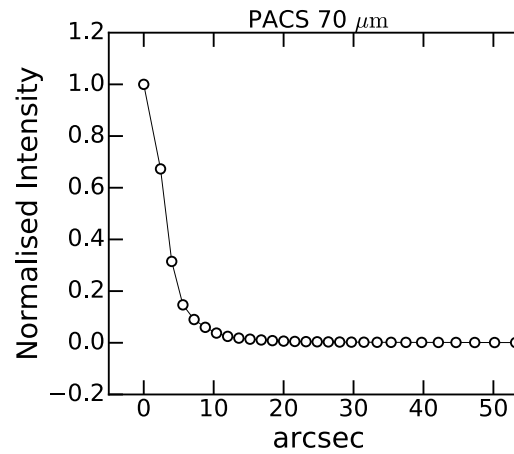

## SED:

- photometry (UV - radio)
- ISO SWS
- PACS & SPIRE

## Intensity profiles:

- PACS photometry

# 4. Radiative Transfer Modeling

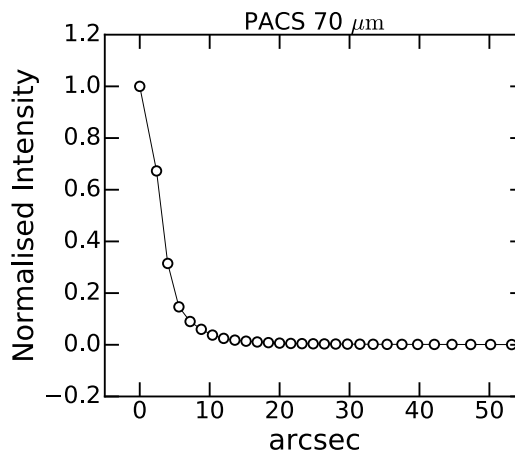

## SED:

- photometry (UV - radio)
- ISO SWS
- PACS & SPIRE

## Intensity profiles:

- PACS photometry

## Radiative transfer Model

- MoDUSTY  
(Ivezic et al. 1999; Groenewegen 2012)

## 5. Example: OH26.5+0.6

- e.g. Justtanont et al. 1996; Chesneau et al. 2005; Groenewegen 2012; Suh & Kwon 2013
- very recent superwind  $\Rightarrow$  thick, spatially small envelope
- Chesneau et al. 2005, mid-IR interferometry: FWHM = 0.28 arcsec

## 5. Example: OH26.5+0.6

- e.g. Justtanont et al. 1996; Chesneau et al. 2005; Groenewegen 2012; Suh & Kwon 2013
- very recent superwind  $\Rightarrow$  thick, spatially small envelope
- Chesneau et al. 2005, mid-IR interferometry: FWHM = 0.28 arcsec

### PARAMETERS

- $T_{\text{eff}} = 2500 \text{ K}$
- $L^* = 10000 L_{\odot}$
- Grain comp.: Si:AlOx:Fe (100 : 10 : 5)
- Grain size:  $0.2 \mu\text{m}$
- $T_{\text{dust}}$  inner shell radius = 600K
- $\tau_V = 180$
- **magenta model:**  $R_{\text{outer}} = 200 \text{ arcsec}$
- **green model:**  $R_{\text{outer}} = 0.6 \text{ arcsec}$   
(~ Chesneau et al. 2005)

- A unique sample of PACS en SPIRE spectroscopy for 38 targets
- Radiative transfer modeling of SED and Intensity Profiles

➔ Constraints on **globular wind properties**, especially **intermediate and outer wind**

- A unique sample of PACS en SPIRE spectroscopy for 36 targets
- Radiative transfer modeling of SED and Intensity Profiles

➔ Constraints on **globular wind properties**, especially **intermediate and outer wind**

- Study **more spatial scales** for selection of targets:
  - VLTI MIDI interferometry (MID-IR): dust formation region
  - ALMA submm interferometry: high spatial and high velocity resolutions

- A unique sample of PACS en SPIRE spectroscopy for 36 targets
- Radiative transfer modeling of SED and Intensity Profiles

➔ Constraints on **globular wind properties**, especially **intermediate and outer wind**

- Study **more spatial scales** for selection of targets:
  - VLTI MIDI interferometry (MID-IR): dust formation region
  - ALMA submm interferometry: high spatial and high velocity resolutions

Central Star ➔ inner part (dust formation & wind acceleration) ➔ outer parts
