DAMA's Signal Not Spin-Independent WIMPs

LETTER

Nature 564, 83–86 (2018)

<https://doi.org/10.1038/s41586-018-0739-1>

An experiment to search for dark-matter interactions using sodium iodide detectors

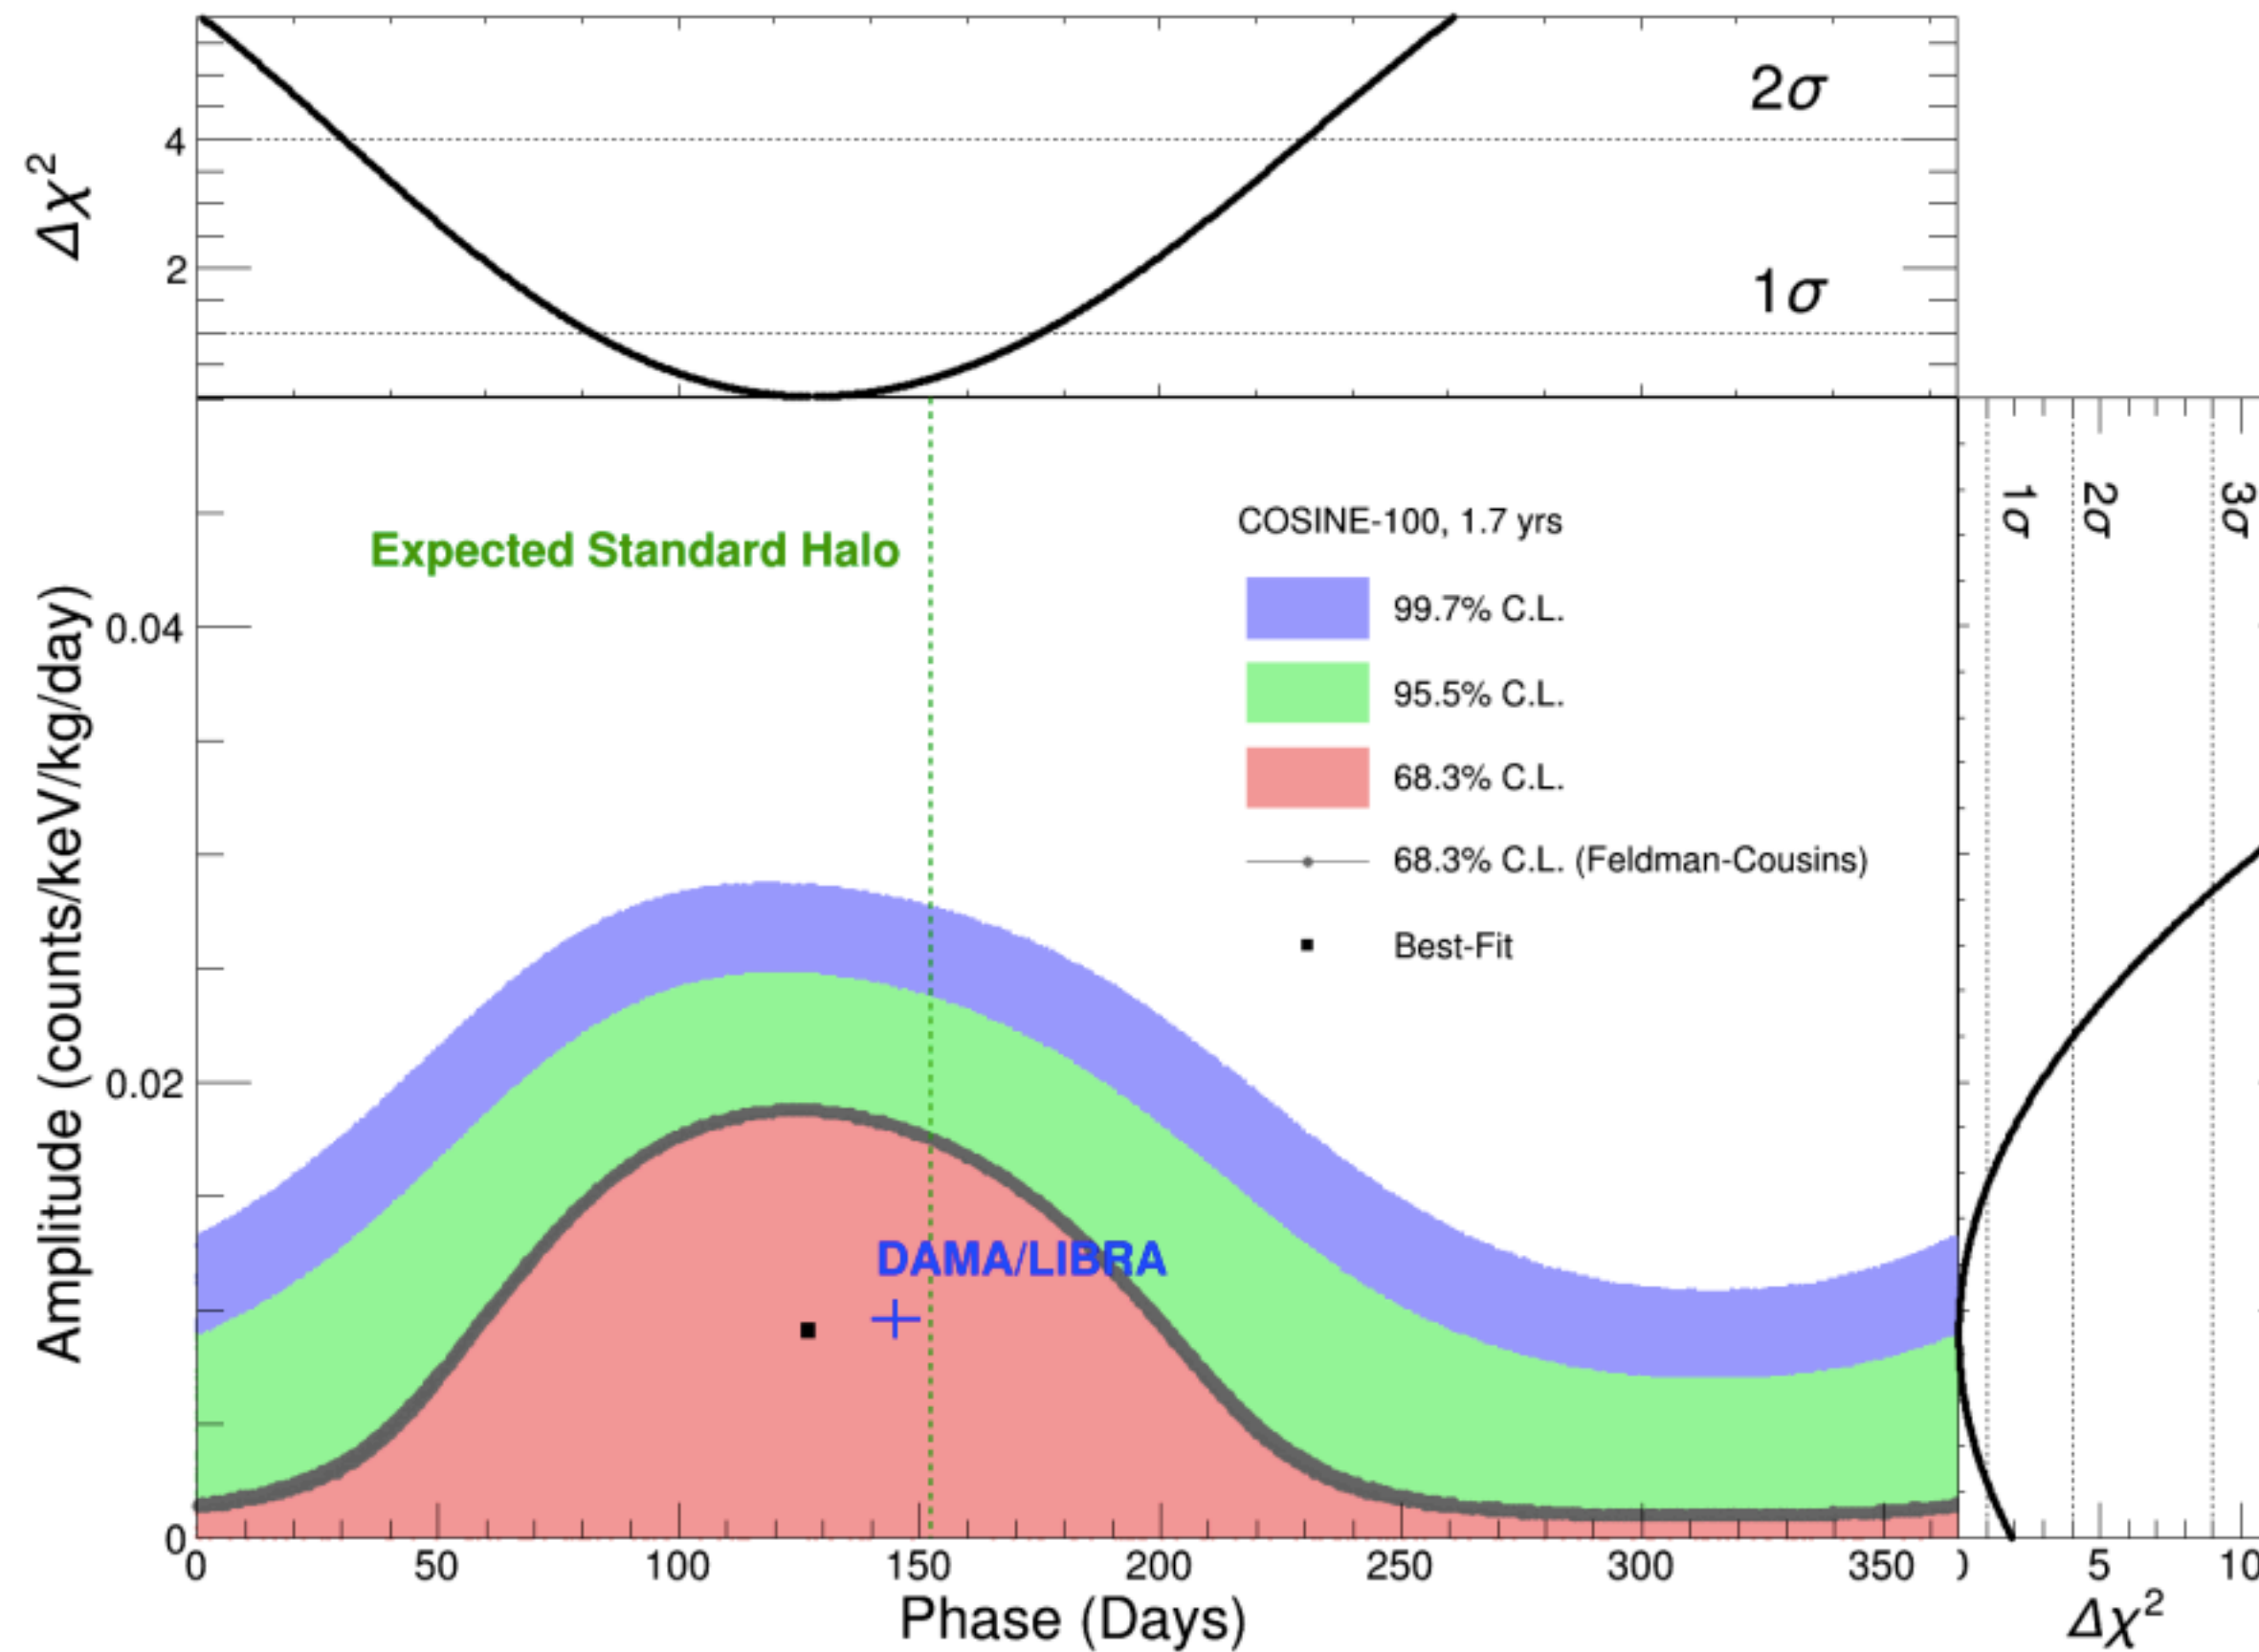

COSINE-100 First Modulation Results

Phys. Rev. Lett. 123. 031302 (2019)

Search for a Dark Matter-Induced Annual Modulation Signal in NaI(Tl) with the COSINE-100 Experiment

2-6 keV

Annual Modulation

The Highs

In June, Earth moves at its fastest speed through the dark matter halo.

Sun and Earth move in the same relative direction

Earth passes through many dark matter particles

The Lows

In December, Earth moves at its slowest speed.

Earth and sun orbits are opposed

Earth encounters fewer particles

The DAMA Experiment

- ▶ NaI(Tl) experiment: 250 kg @ LNGS
- ▶ Avg background: ~ 1 count/keV/kg/day
- ▶ Looking for annual modulation of rate

arXiv:1805.10486

- ▶ How to confirm this signal?

- Use same target material: NaI(Tl)
- Have low enough backgrounds: modulation amplitude is small
- Look for time dependent components in backgrounds

NaI(Tl) Global Effort

KIMS (+ DM-Ice)

COSINE-100 Backgrounds

Eur. Phys. J. C78 (2018) 490

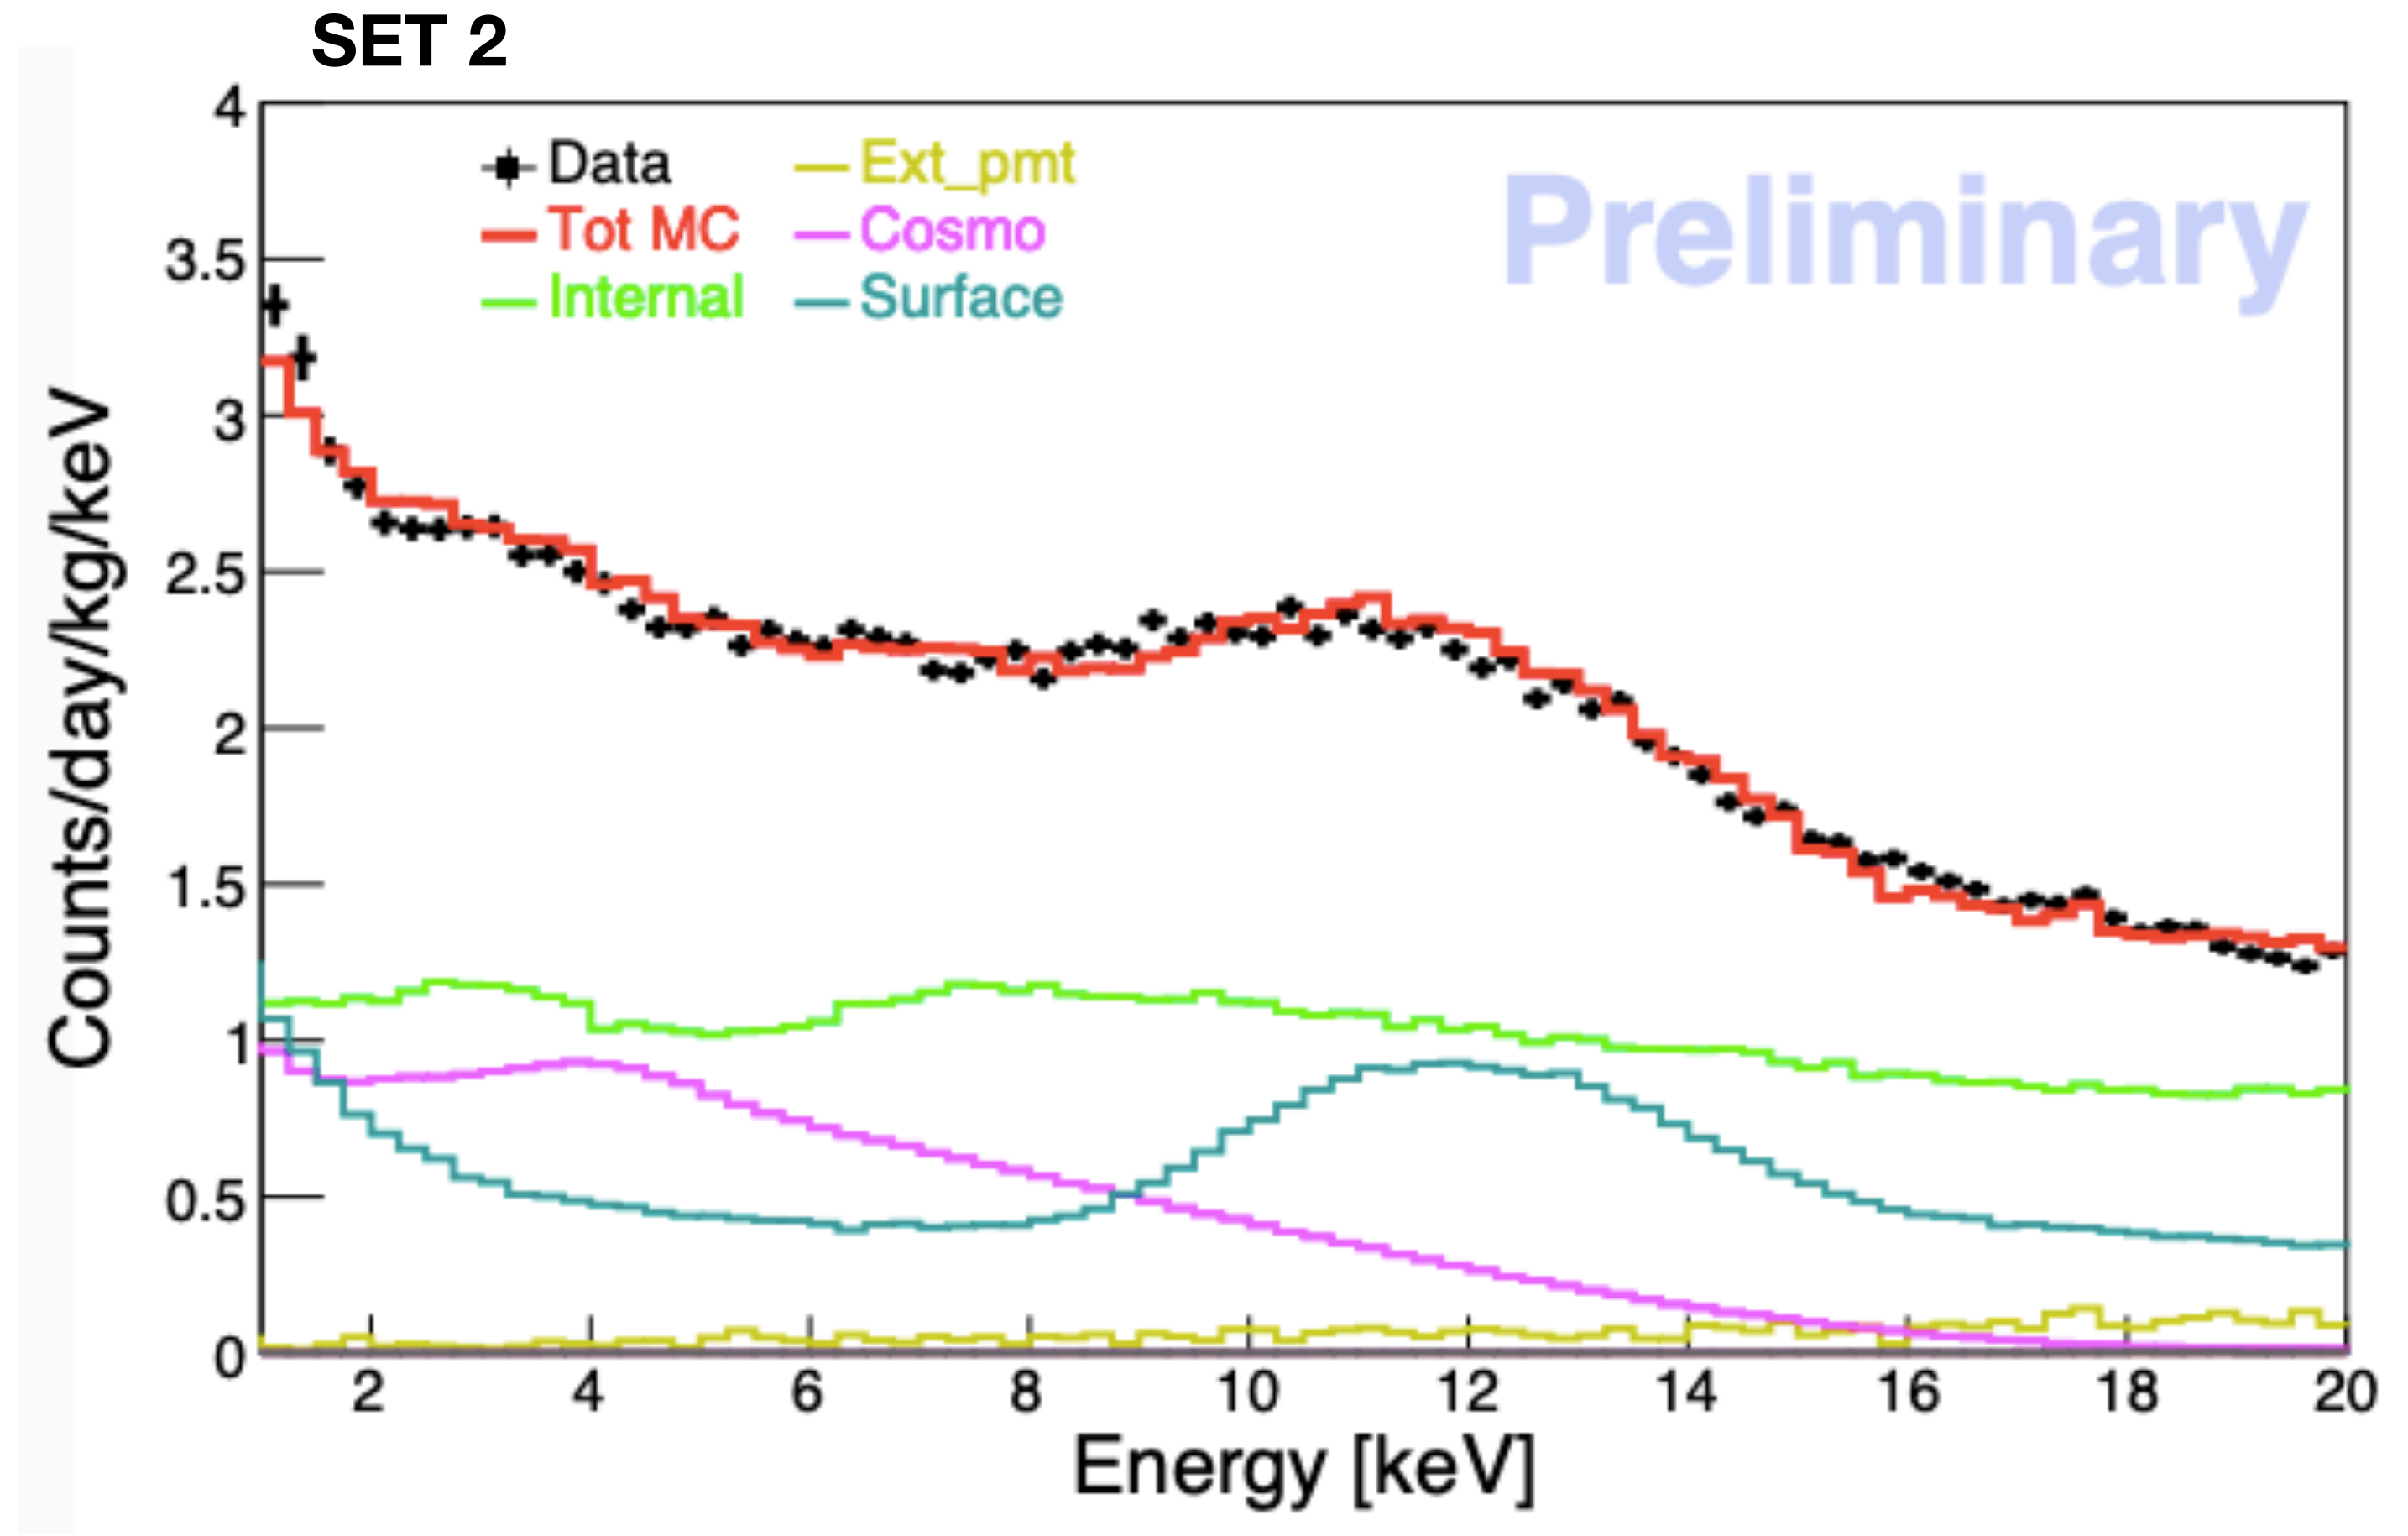

- ▶ Full detector simulation with Geant4 + multi-channel fit: **background well modeled**
- ▶ Main low energy backgrounds:
 - Internals: crystals' intrinsic contaminants - K/U/Th chains
 - Cosmogenics: dominated by ^3H in R.O.I (2-20 keV)
 - Surface: ^{210}Pb in crystals and teflon surfaces

COSINE-100 Backgrounds - Improved

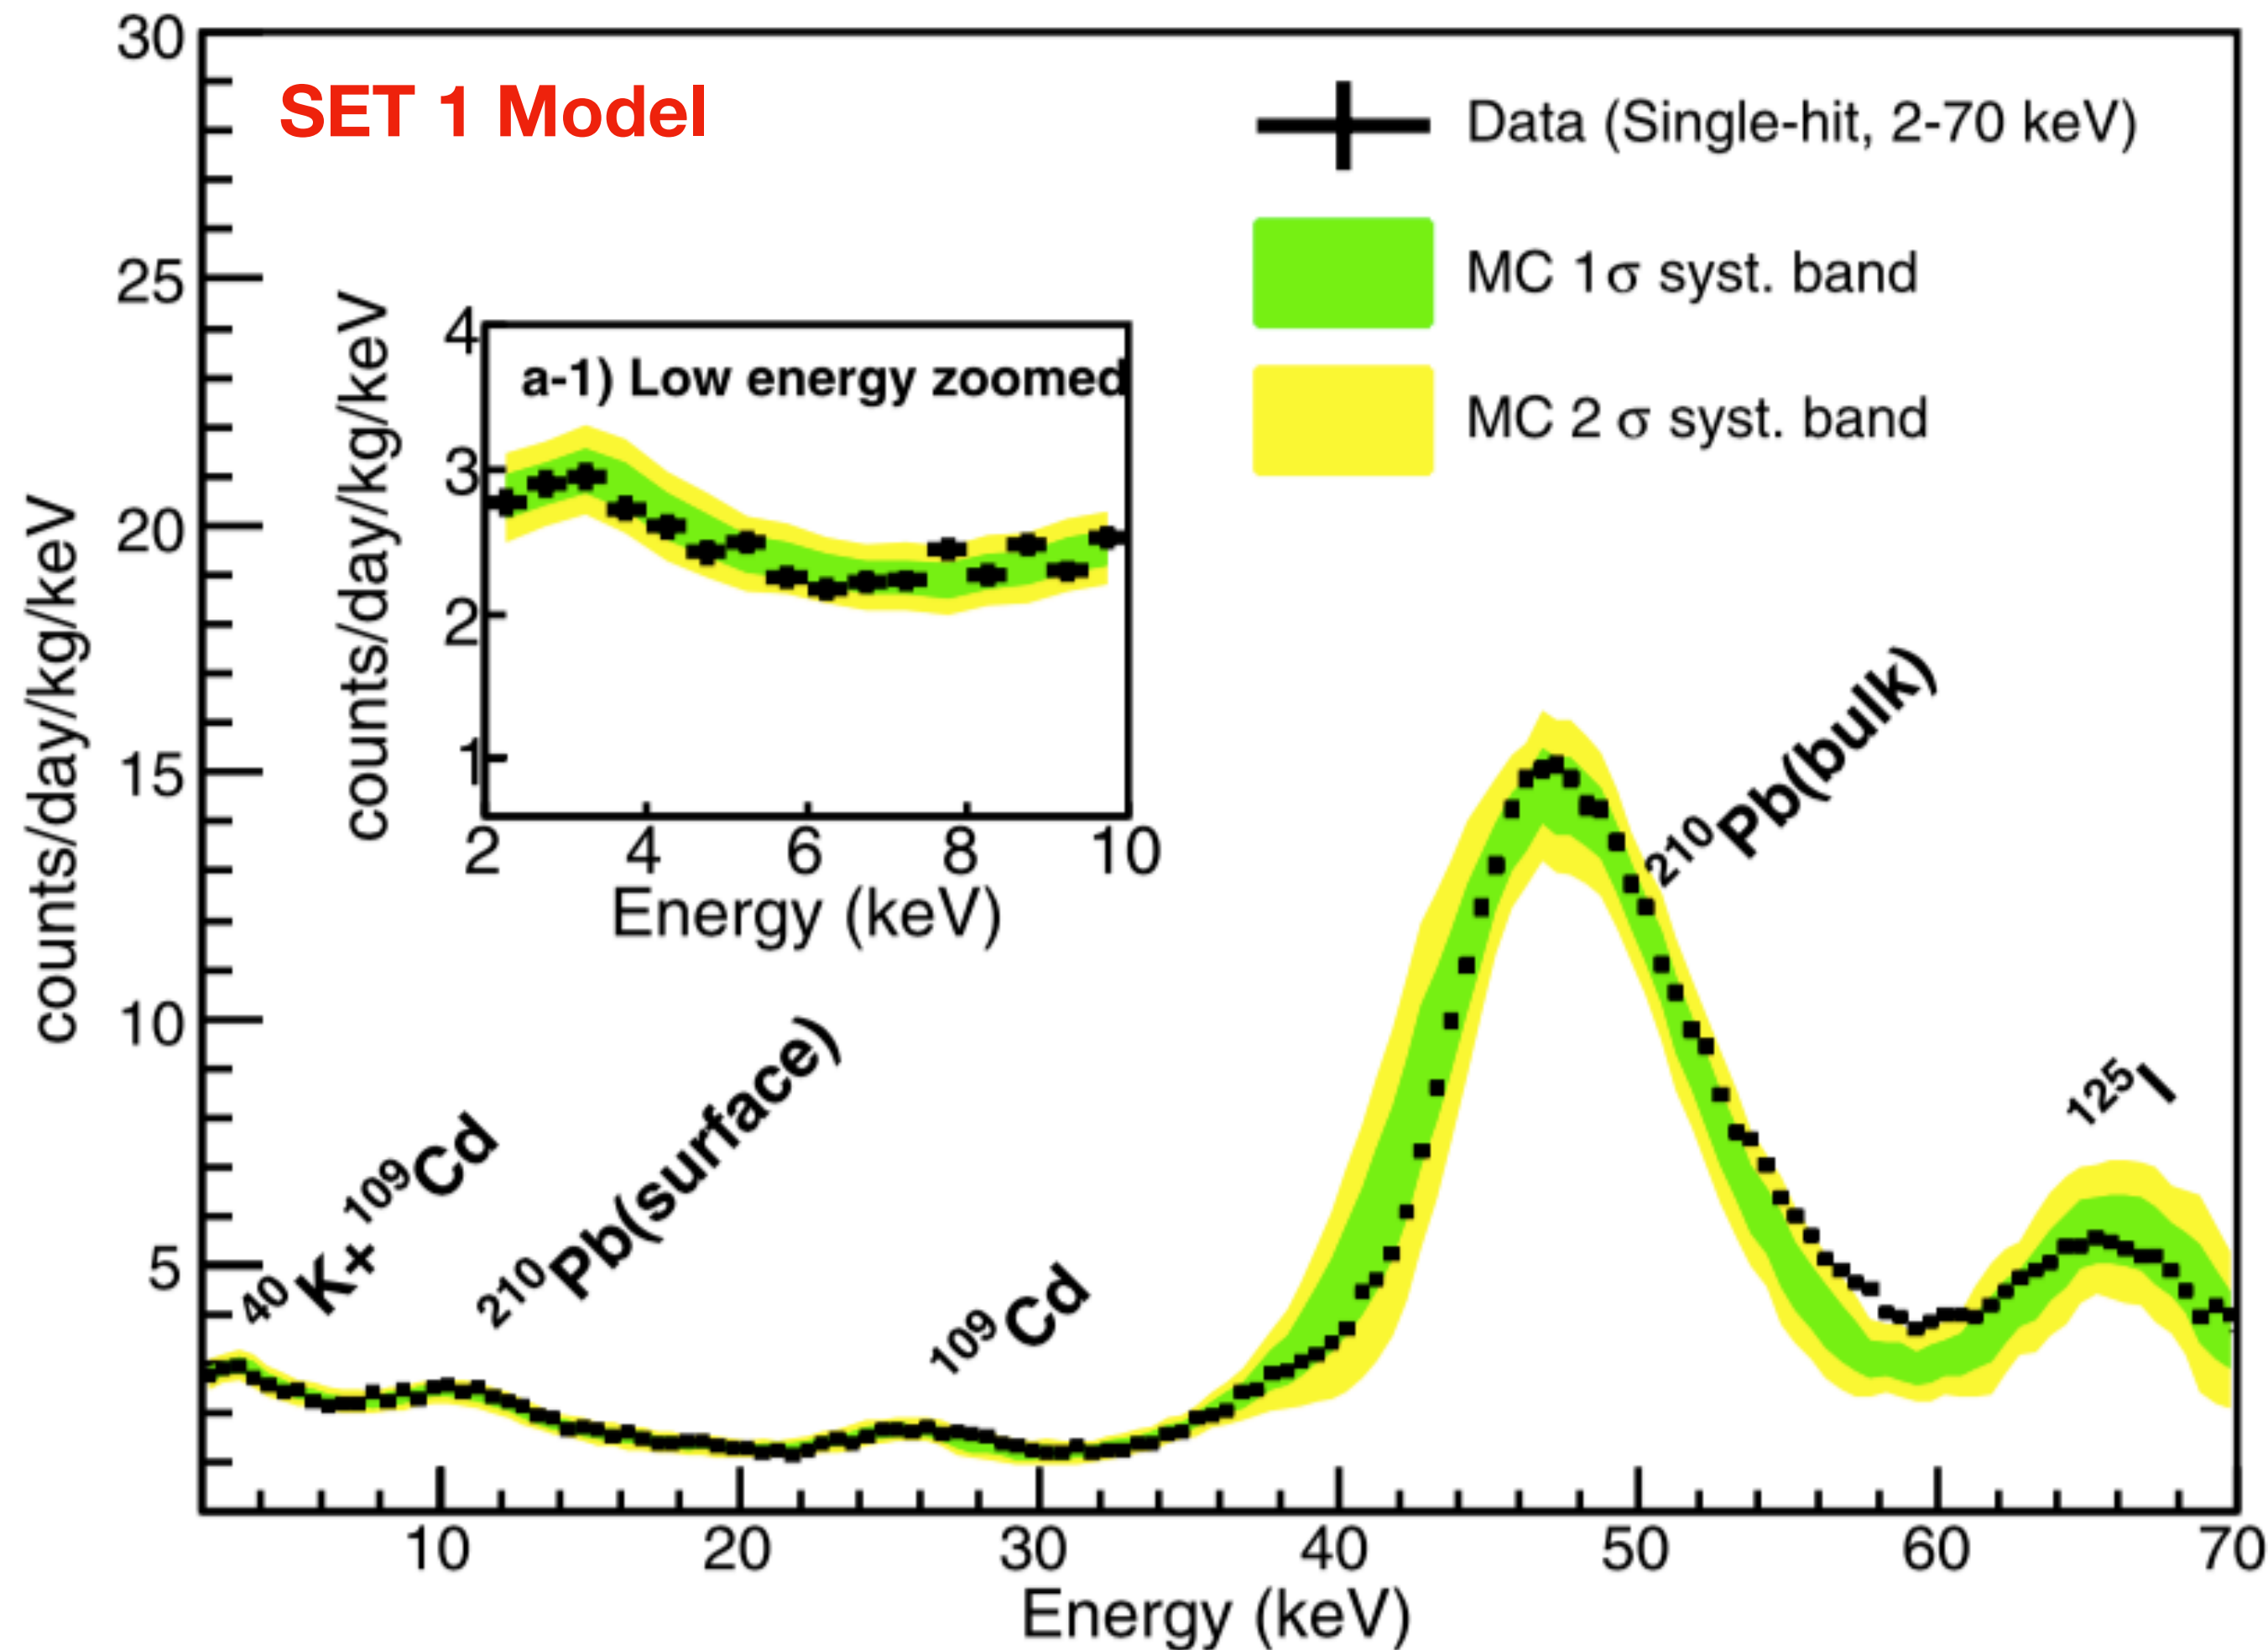

- ▶ Full detector simulation with Geant4 + multi-channel fit: **background well modeled**
- ▶ Updated background modeling:
 - Lower energy threshold, down to **1 keV**
 - Improved event selection and efficiencies
 - Updated simulation package
 - Larger data set: SET2

G. Adhikari, TAUP 2019

COSINE-100 Backgrounds & Fit

- ▶ Estimated systematics: resolution, efficiency, energy scale, simulation package, PMT background
- ▶ Crystals are fitted simultaneously to a WIMP-signal model, for different WIMP masses

WIMP Analysis: Backgrounds + WIMP

a) Crystal 1

b) Crystal 2

c) Crystal 3

d) Crystal 4

e) Crystal 6

f) Crystal 7

Spin-Independent WIMP Search

- ▶ Exclusion of DAMA/LIBRA-phase1 spin-independent signal, standard halo model interpretation
- ▶ First time excluded with same target material

Annual Modulation Search

Phys. Rev. Lett. **123**, 031302 (2019)

Backgrounds, constrained:
Different for each crystal

Signal, floated:
Same for all the crystals

$$\text{Rate} = C + p_0 \cdot \exp\left(-\frac{\ln 2 \cdot t}{p_1}\right) + A \cdot \cos\left(\frac{2\pi(t - t_0)}{T}\right)$$

- ▶ 1.7 yr of data, 97.7 kg·yr of exposure
- ▶ Fitting an offset + exponential component + cosine function
- ▶ 15-day bins, with data starting in Oct 2016
- ▶ Backgrounds constrained based on background modeling

First Annual Modulation Results

- ▶ Results in 2-6 keV region agree with null hypothesis and DAMA/LIBRA results, due to statistical limitations
 - **Amp: 0.0092 ± 0.0067 counts/keV/kg/day; Phase: 127.2 ± 45.9 days**
- ▶ A lower threshold, improved event selection, and larger data set are in the pipeline

Phys. Rev. Lett. **123**, 031302 (2019)

Next Annual Modulation Search Sensitivity

- ▶ Larger data set: SET 3 with $\sim 154 \text{ kg}\cdot\text{yr}$ exposure, 2.5 yr of data
- ▶ Improved event selection down to 1 keV threshold
- ▶ Improved background modeling, with updated simulation package and better understanding of surface components
- ▶ Expected sensitivity (for null hypothesis) shows that we will still be statistically limited

Summary and Outlook

- ▶ COSINE-100 has been running since September 2016.
- ▶ 60 days of data strongly disfavors spin-independent WIMPs as the cause for DAMA's signal.
- ▶ First annual modulation results with 1.7 yr are consistent with DAMA signal and no modulation hypothesis
- ▶ A second batch of analyses with lower threshold, larger data set, and improved background modeling is underway
- ▶ Stay tuned for more exciting results!

Thanks!
