

# NEUTRINOS:

## The messengers of the invisible world

*Loin d'être un appauvrissement, l'adjonction à la chose visible de la chose invisible fait plus que de l'enrichir, elle lui donne un sens, elle la complète.*

*Far from being an impoverishment, the addition to the visible thing of the invisible thing does more than enrich it, it gives it a meaning, it completes it.*

Paul Claudel    (*Positions et propositions*)

# The three types of neutrinos

# Sources of neutrinos

# SuperKamiokande

Constructed under a mountain in Japan, SuperK is an immense reservoir full of 50 kilotonnes of purified water, spied by 11000 giant photomultiplier tubes.

- In water charged particles emit Cerenkov light. Energy-threshold for electrons is 5 MeV.
- *SuperK has studied solar as well as atmospheric neutrinos.*

# Neutrino-graphy in real time

# Result of SuperK

- In 1500 days, SuperK detected 22000 events when 48000 were predicted.

- Problem of the solar *deficit*  
First seen by Homestake then confirmed by Gallex.

SuperK also detected a deficit of atmospheric neutrinos

# OSCILLATIONS ?

- The *deficit* of neutrinos can be explained by a spontaneous change of the neutrino type during its propagation (the SK detector counts only solar  $\nu_e$ ).

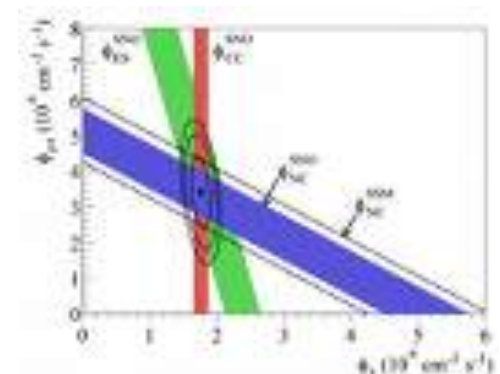

God plays dice with neutrinos!

# The SNO experiment

- The target consists in 1000 tonnes of heavy water  $D_2O$ .
- SNO measures separately the flux of  $\nu_e$ , but also the other types.

- Agreement between total flux and predictions,  $\nu_e$  represent  $\sim 1/3$  of the total.

# Phenomenology of oscillations

Interaction states  $\nu_e \nu_\mu \nu_\tau$  differ from mass states (propagation)  
 $\nu_1 \nu_2 \nu_3$

*Unitary mixing matrix (with 2 neutrinos):*

$$\begin{aligned}\nu_e &= \nu_1 \cos\theta + \nu_2 \sin\theta \\ \nu_\mu &= -\nu_1 \sin\theta + \nu_2 \cos\theta\end{aligned}$$

*Probability of oscillation:*

$$\mathcal{P} = \sin^2 2\theta \sin^2(\pi L/\Lambda)$$

With an oscillation length  $\Lambda = 2,5 \text{ E}(\text{GeV})/\Delta m^2(\text{eV}^2)$

# Masses of the neutrinos

In the simplest scenario one obtains:

$$m(\nu_3) \sim 50 \text{ meV}/c^2$$

$$m(\nu_2) \sim 9 \text{ meV}/c^2$$

$$m(\nu_1) \text{ smaller}$$

*The heaviest neutrino has a mass 20 billion times smaller than that of the proton. The Big Bang model predicts 2 billion times more neutrinos than protons.*

Admirable conclusion : neutrinos weigh as much as all the stars of all the galaxies !

*But there is much more in the Universe!!*

# Analysis of the CMB

Before Planck

After Planck

$$\Sigma m_\nu < 0.23 \text{ eV}$$

# The large kyrielle of questions

Why 3 active neutrinos ?

Mass hierarchy normal or inverted ?

Violation of CP ?

Nature of the neutrinos, Dirac or Majorana?

Electromagnetic interactions?

Sterile neutrinos?

Neutrinos of astrophysics ?

Neutrinos of the Big Bang?

# Conclusions

Very recent progresses: neutrinos are massive.

$$m(\nu_3) = 50 \text{ meV}, m(\nu_2) = 9 \text{ meV}, m(\nu_1) = ?$$

*They represent  $\approx 0,5\%$  of the mass-energy of the Universe.*

Responsible for antimatter disappearance?

Solution to the problem of Dark Matter?

Solution to the puzzle of Dark Energy?

### *Cosmic Gall*

*Neutrinos, they are very small  
They have no charge and have no mass  
And do not interact at all.  
The earth is just a silly ball  
To them, through which they simply pass,  
Like dustmaids down a drafty hall  
Or photons through a sheet of glass.  
They snub the most exquisite gas,  
Ignore the most substantial wall,  
Cold-shoulder steel and sounding brass,  
Insult the stallion in his stall,  
And, scoring barriers of class,  
Infiltrate you and me. Like tall  
And painless guillotines, they fall  
Down through our heads into the grass.  
At night, they enter at Nepal  
And pierce the lover and his lass  
From underneath the bed-you call  
It wonderful: I call it crass.*

*John Updike 1960*
