Telescope Array Detectors

Fluorescence Detectors (FDs)
 Middle Drum (MD) station
 14 telescopes
 + TA Low energy Extension (TALE) 10 telescopes

Surface Detector (SD) array
 507 scintillation detectors, each 3m²
 1.2 km spacing
 total coverage ~ 700km²

FDs
 Black Rock Mesa (BRM) station
 12 telescopes

FDs
 Long Ridge (LR) station
 12 telescopes

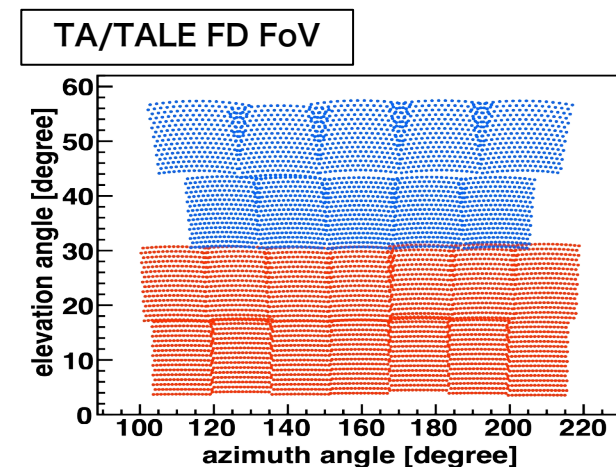

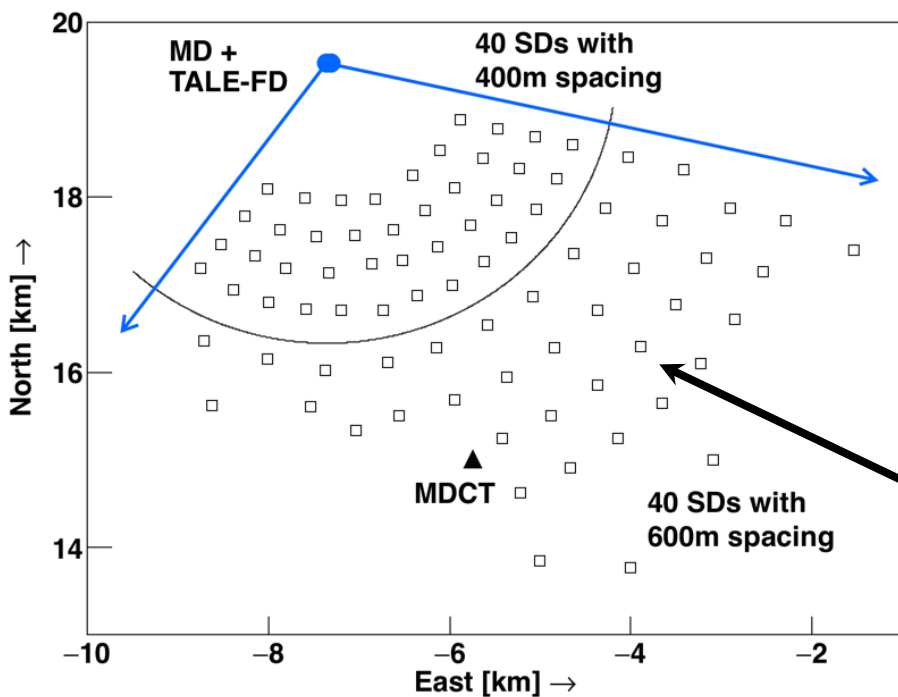

TA Low energy Extension (TALE)

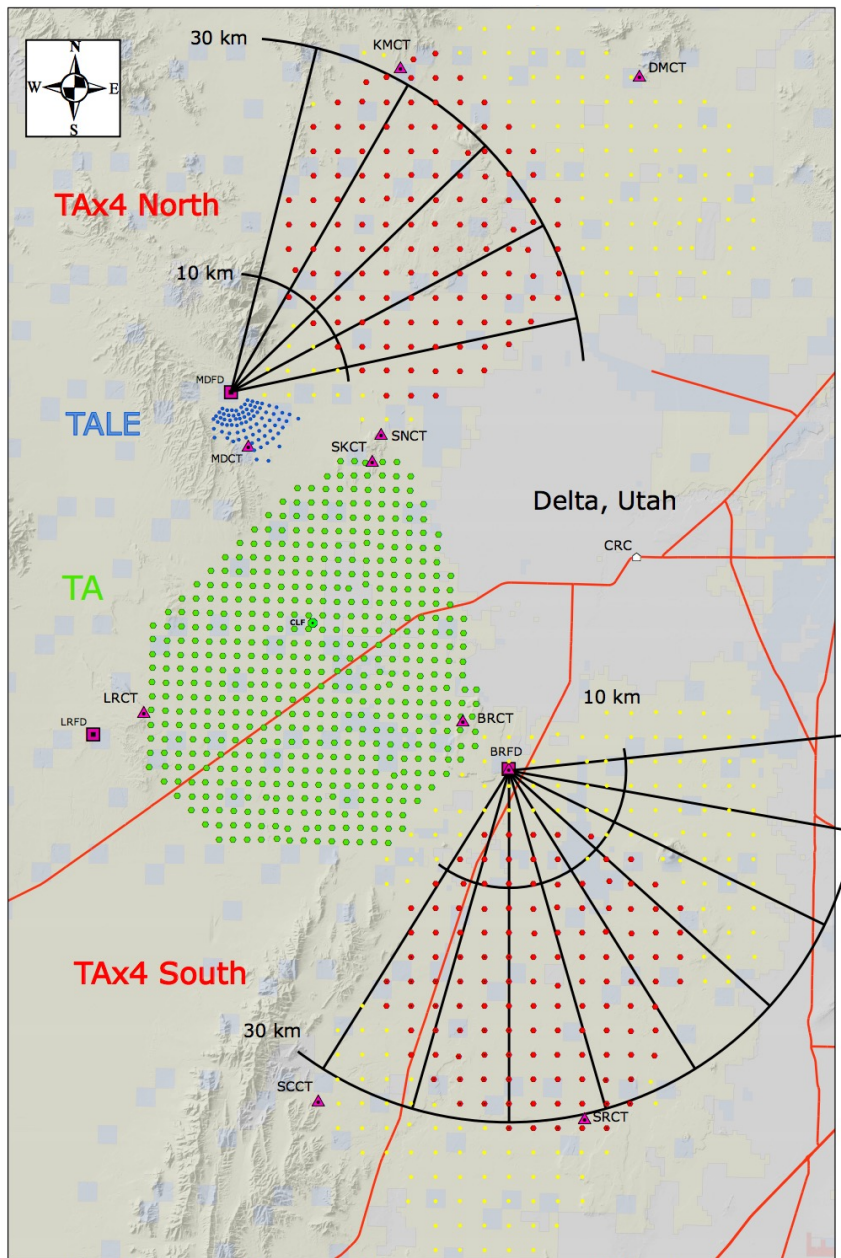

5

- Low energy CRs-induced shower
 - Not so bright, higher X_{\max}
→ high elevation telescope
 - compact shower size
→ dense SD array
- Constructed in north part of TA site
- Same concept as TA detector
 - 10 Fluorescence Telescopes
 - 80 Surface Detectors, 20 km²
- Low energy target: $E > 10^{16}$ eV
- Operation: FD since Sep. 2013
SD since Nov. 2017

TAx4 Detectors

- Focus on highest energies
 - $E > 10^{19.5}$ eV
- New Northern and Southern SD array
 - expand TA SD area by factor 4
~3000 km²
 - 2.08 km spacing (TA: 1.2km)
- New 4 + 8 FDs
- In operation both detectors
 - over 3 yrs data taking

Event Reconstruction, Hybrid/Stereo

- time vs. angle fit to obtain shower geometry
 - in hybrid: add SD info.
 - most precise shower geometry
- stereo case: 2FDs observe same shower
 - intersect shower image
- shower profile reconstruction using signal intensities
- Integral of dE/dX to obtain energy
 - $E \propto \int_0^{\infty} \frac{dE}{dX} dX$
- Achieve $\sim 8\%$ E resolution

Event Reconstruction, FD

Low energy event

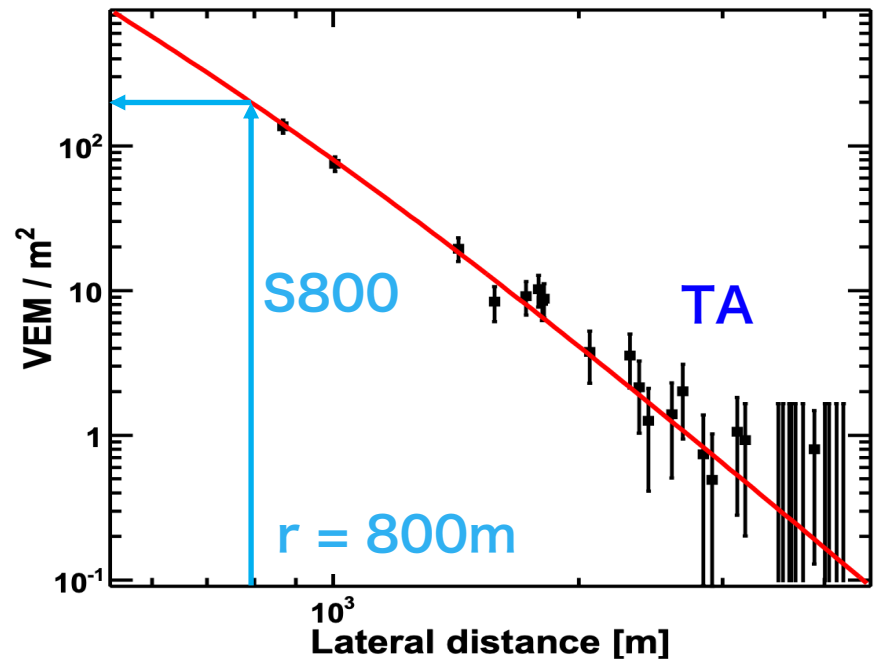

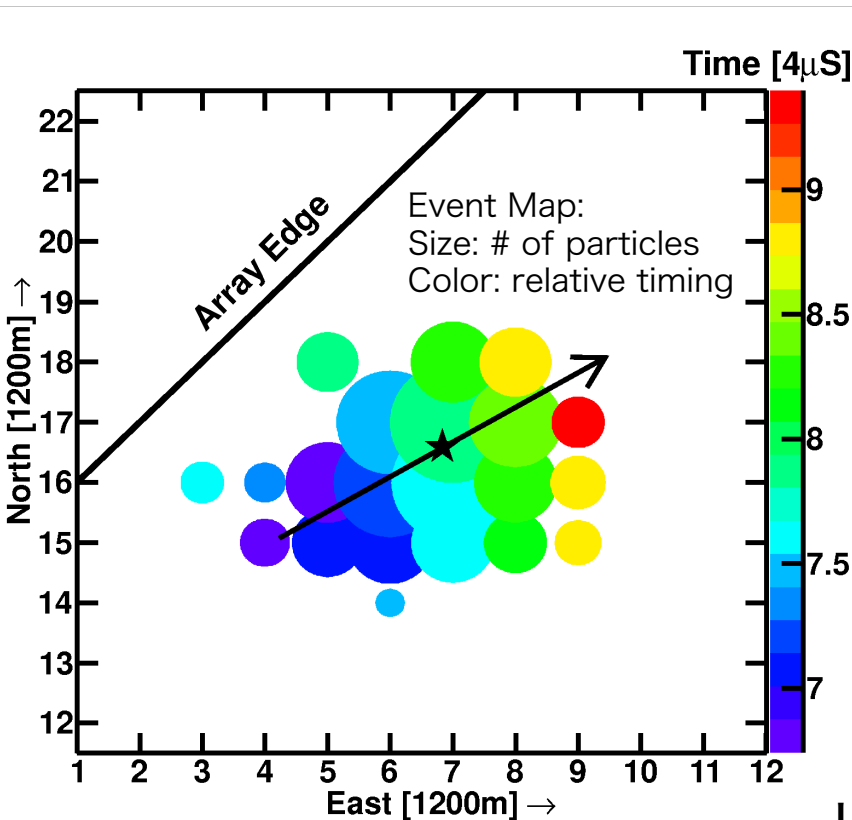

- detect Cherenkov light like IACT
→ achieve low energy threshold
- simultaneous reconstruction for shower geometry and shower profile
 - constrained shower geometry by shower profile because of Cherenkov light directivity

- Integral of dE/dX to obtain energy
 - $E \propto \int_0^{\infty} \frac{dE}{dX} dX$
 - same way as high energies
- Achieve $\sim 1^\circ$ angular resolution
 $\sim 10\%$ E resolution @10PeV

Event Reconstruction, SD

- Measured footprint
- Arrival direction reconstructed using relative timing differences
- LDF fit has done to obtain energy estimator

$$\text{LDF: } S(r) = A \left(\frac{r}{91.6\text{m}} \right)^{-1.2} \left(1 + \frac{r}{91.6\text{m}} \right)^{-\{\eta(\theta)-1.2\}} \left(1 + \left[\frac{r}{1000\text{m}} \right]^2 \right)^{-0.6}$$

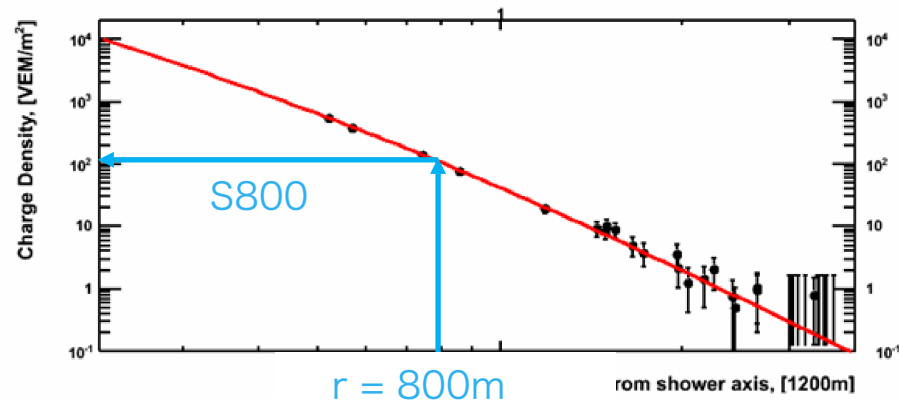

Primary Energy determination, SD

→ Energy look-up table (S800, θ)

Scale to FD(Hybrid) energy

$$E_{SD} = E'_{SD} / 1.27$$

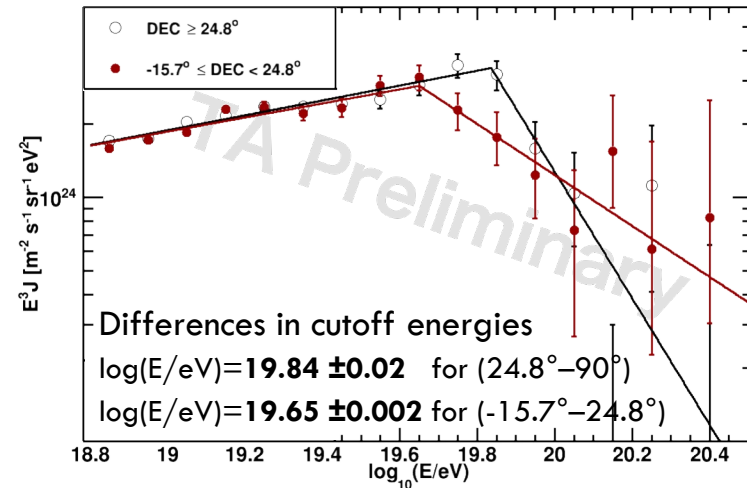

Energy Spectrum

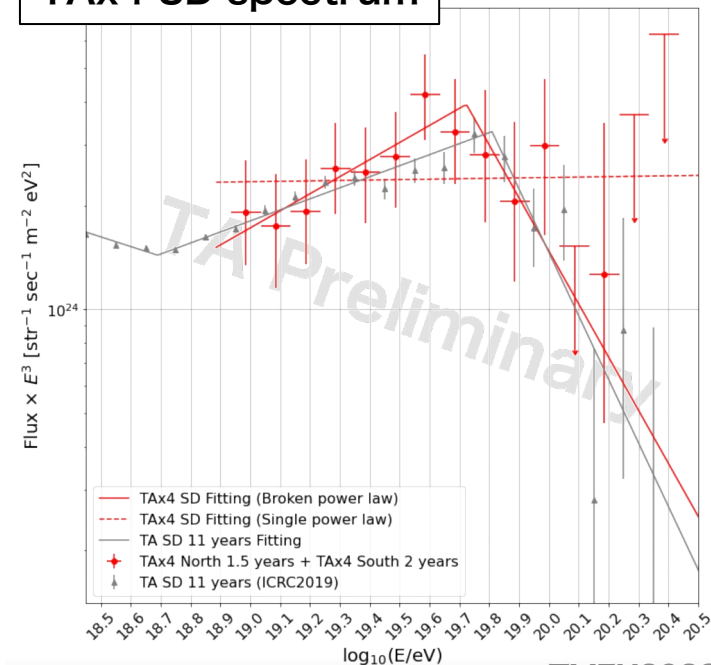

Energy Spectrum in UHE

- Energy spectrum ($E > 10^{18}$ eV)
 - 14 yrs TA SD
 - declination dependence
 - 2yrs TAx4 SD ($E > 10^{19}$ eV)

TA SD, Declination Dependence

TAx4 SD spectrum

New feature in energy spectrum

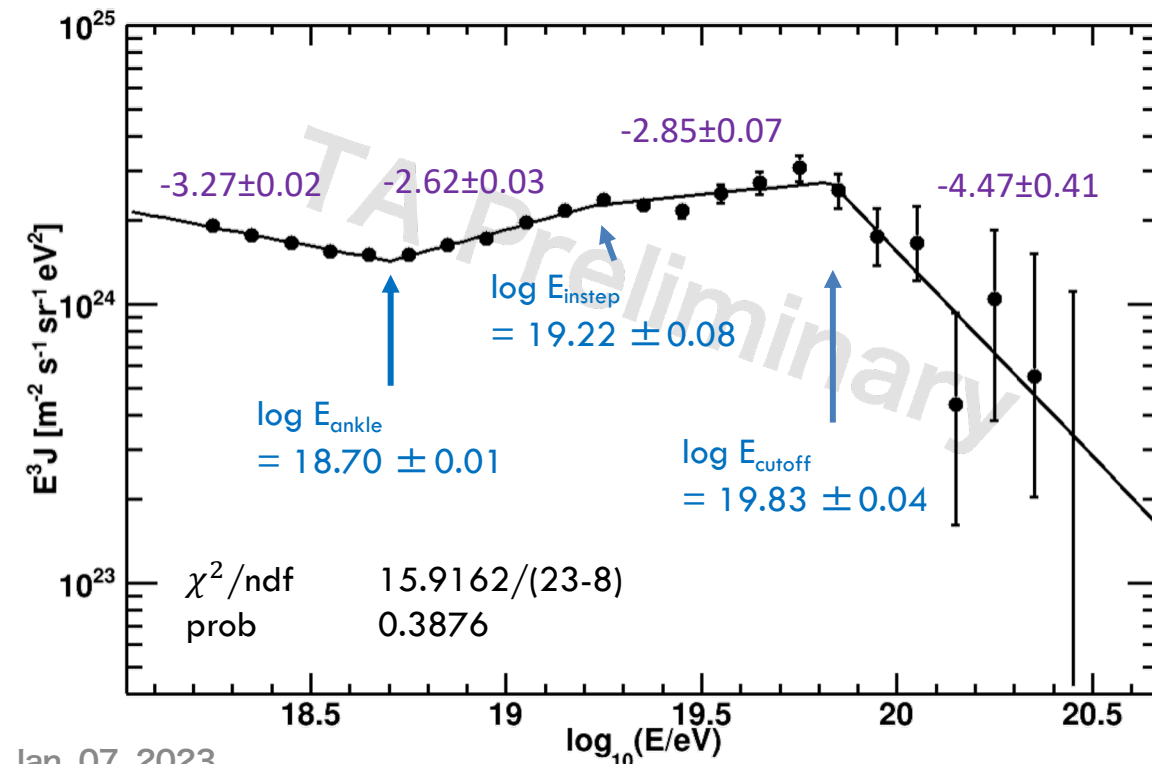

Pierre Auger found a spectrum hardening in $10^{19} - 10^{19.5}$ eV range

- 2-step softening after the ankle
- Two-step softening exists in TA SD spectrum
- 4.0σ deficit above $10^{19.22}$ eV from an assumption of no breaks before the high-energy steepening

A. Aab et al. (The Pierre Auger Collaboration)
Phys. Rev. Lett. 125, 121106 (2020)

	Auger	TA
γ_1	-3.29 ± 0.02	-3.23 ± 0.02
γ_2	-2.51 ± 0.03	-2.63 ± 0.03
γ_3	-3.05 ± 0.05	-2.85 ± 0.07
γ_4	-5.1 ± 0.3	-4.47 ± 0.41
$E_{\text{ankle}} / \text{EeV}$	5.0 ± 0.1	5.0 ± 0.1
$E_{\text{instep}} / \text{EeV}$	13 ± 1	17 ± 3
$E_{\text{cutoff}} / \text{EeV}$	46 ± 3	68 ± 7

Energy Spectrum in lower energy

- TALE FD monocular mode measurement
- Cherenkov dominated spectrum

TALE Energy Spectrum (Monocular)

Energy	Source	Value	Contribution to Flux
$<10^{17}$ eV	photonic scale	10%	20%
$<10^{17}$ eV	missing energy	10%	20%
$<10^{17}$ eV	atmosphere	0	0
$<10^{17}$ eV	Cherenkov model	5%	10%
$<10^{17}$ eV	fluorescence yield	0	0
$<10^{17}$ eV	composition (X_{\max})	3%	6%
10^{18} eV	photonic scale	10%	20%
10^{18} eV	missing energy	5%	10%
10^{18} eV	atmosphere	2%	4%
10^{18} eV	Cherenkov model	0	0
10^{18} eV	fluorescence yield	10%	20%
10^{18} eV	composition (X_{\max})	3%	6%
$<10^{17}$ eV	total	15%	31%
10^{18} eV	total	15%	31%

Down to 2 PeV with FD measurement

Energy resolution at 2 PeV : 20%

at 6 PeV : 15%

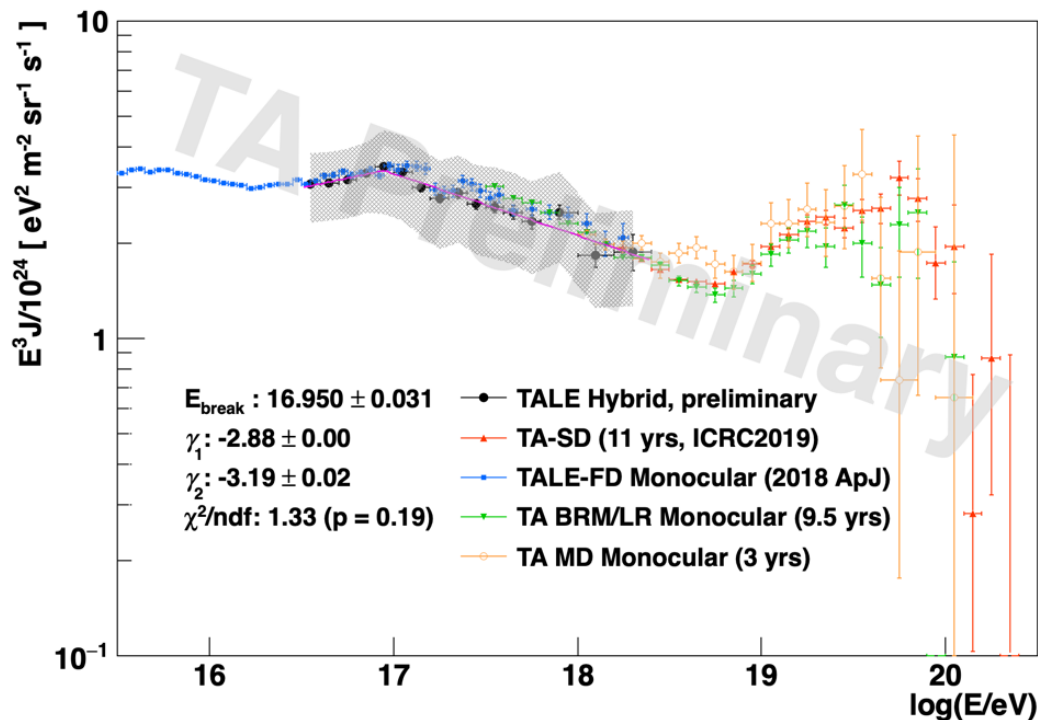

at 100 PeV: 10%

Energy Spectrum in lower energy

- TALE Hybrid measurement
- 4yrs data

TALE Hybrid Spectrum with TA spectra

	γ_1	$\log_{10}(E_{\text{break}}/\text{eV})$	γ_2
TALE Hybrid	-2.88 ± 0.003	16.95 ± 0.03	-3.19 ± 0.02
TALE Monocular	-2.92 ± 0.01	17.04 ± 0.04	-3.19 ± 0.02
TA SD	-	-	-3.28 ± 0.02
TA BRM / LR FDs	-	-	-3.29 ± 0.01

Summary of systematic uncertainties in energy, X_{max}

Sources	Energy
Photonic Scale	10 %
Relative Time of FD and SD	0
Fluorescence yield	3 to 10%
Cherenkov model	5 to 1 %
Atmosphere	+2.7 % -1.8 %
Missing energy	6 %
Total	12.6 to 15.7 %

Down to $10^{16.5}$ eV
with Hybrid measurement
Energy resolution
at $10^{16.5}$ eV: <10%

Clearly shows break feature
at 10^{17} eV

Energy Spectrum in lower energy

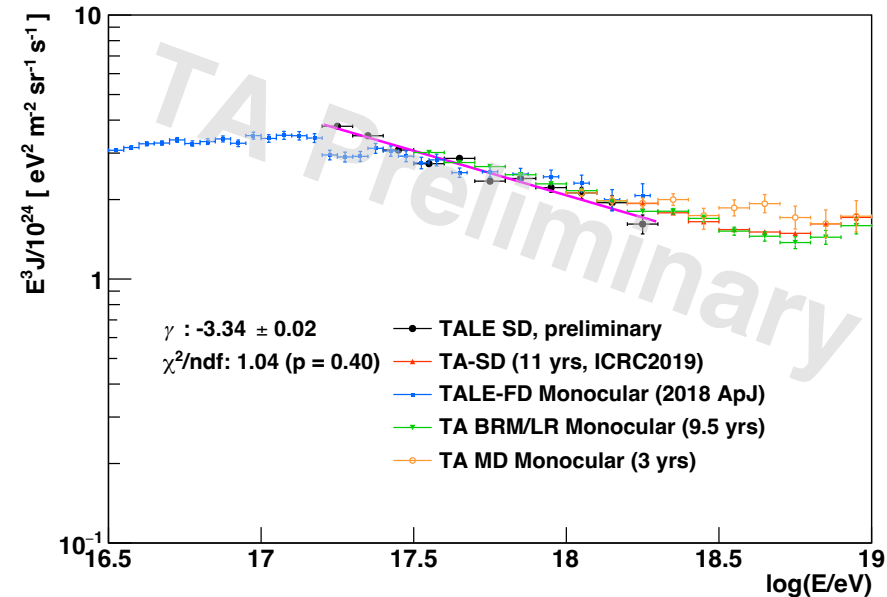

- TALE SD measurement
- 2.5yrs data

TALE SD energy table

Down to $\sim 10^{17}$ eV with only SD array
 Energy estimator: s600
 look up table was made
 - same way as TA SD
 - reconstructed θ and s600 is used
 Finally scaled to FD energy

TALE SD Spectrum

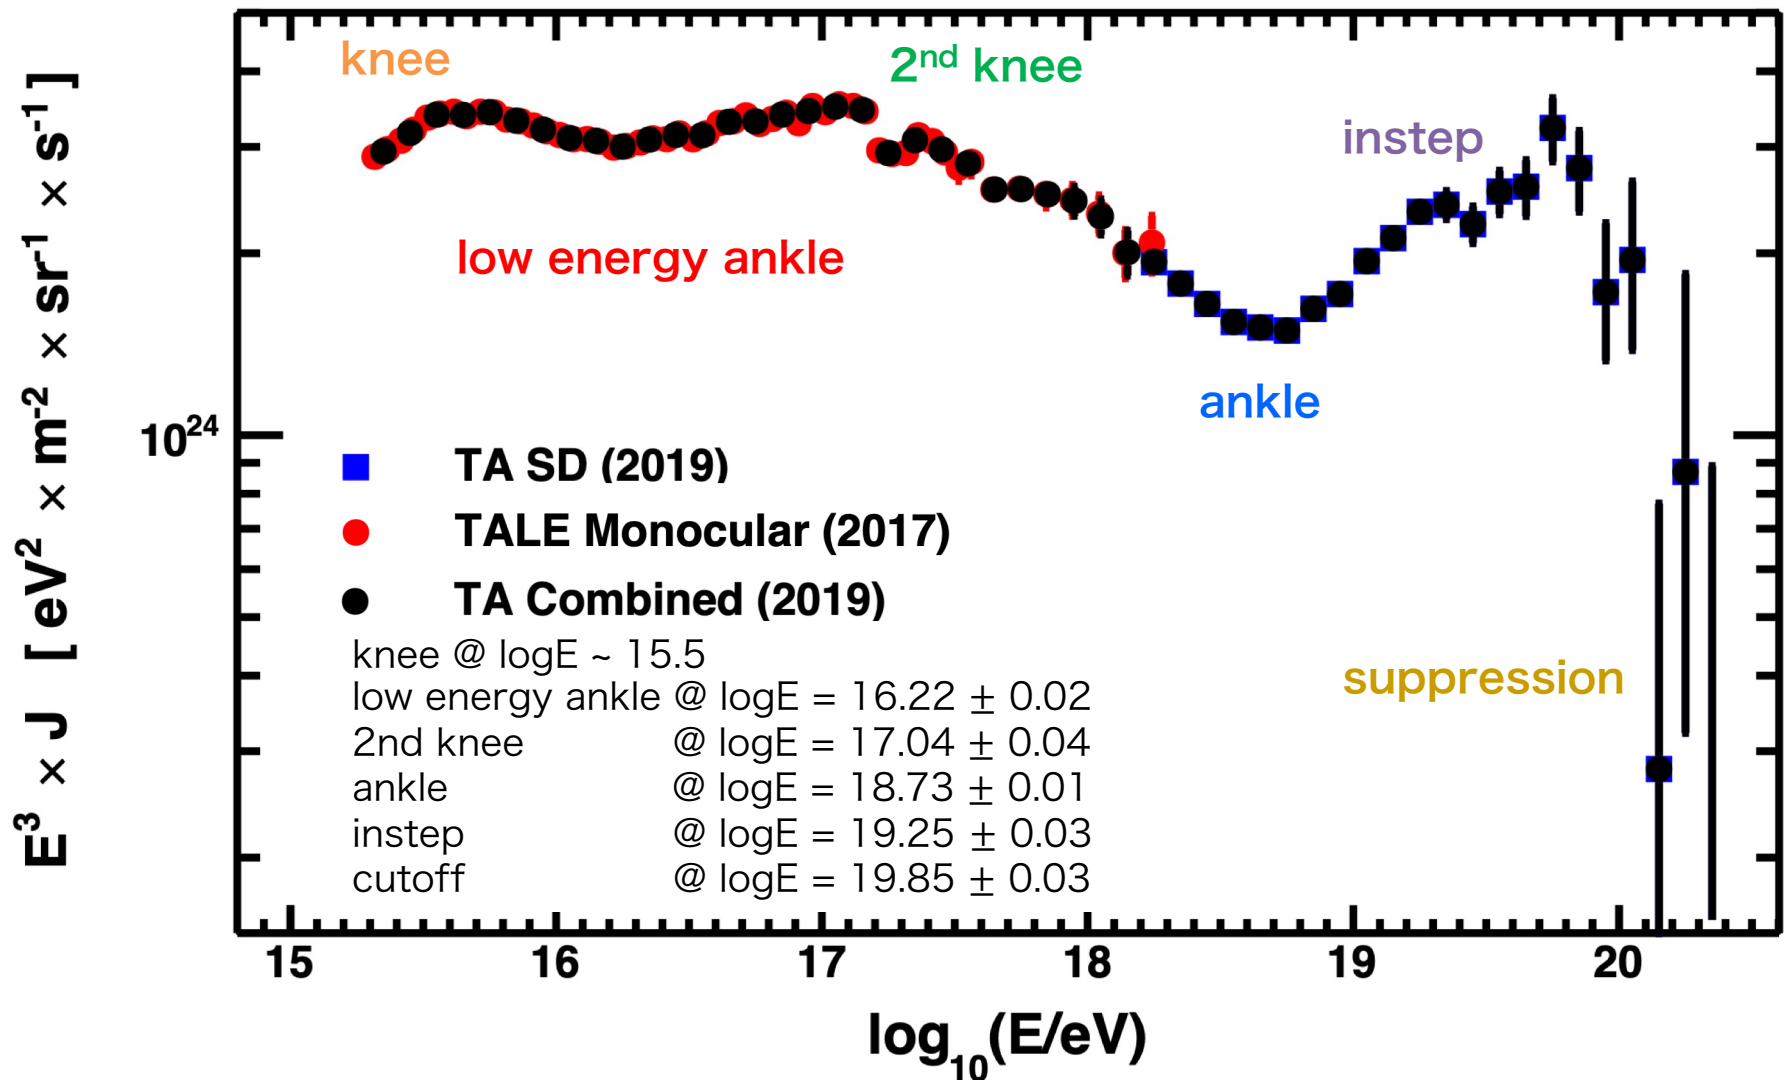

Energy resolution
 $E > 10^{17}$ eV: $\sim 20\%$

Consistent with TA results

TA energy spectrum

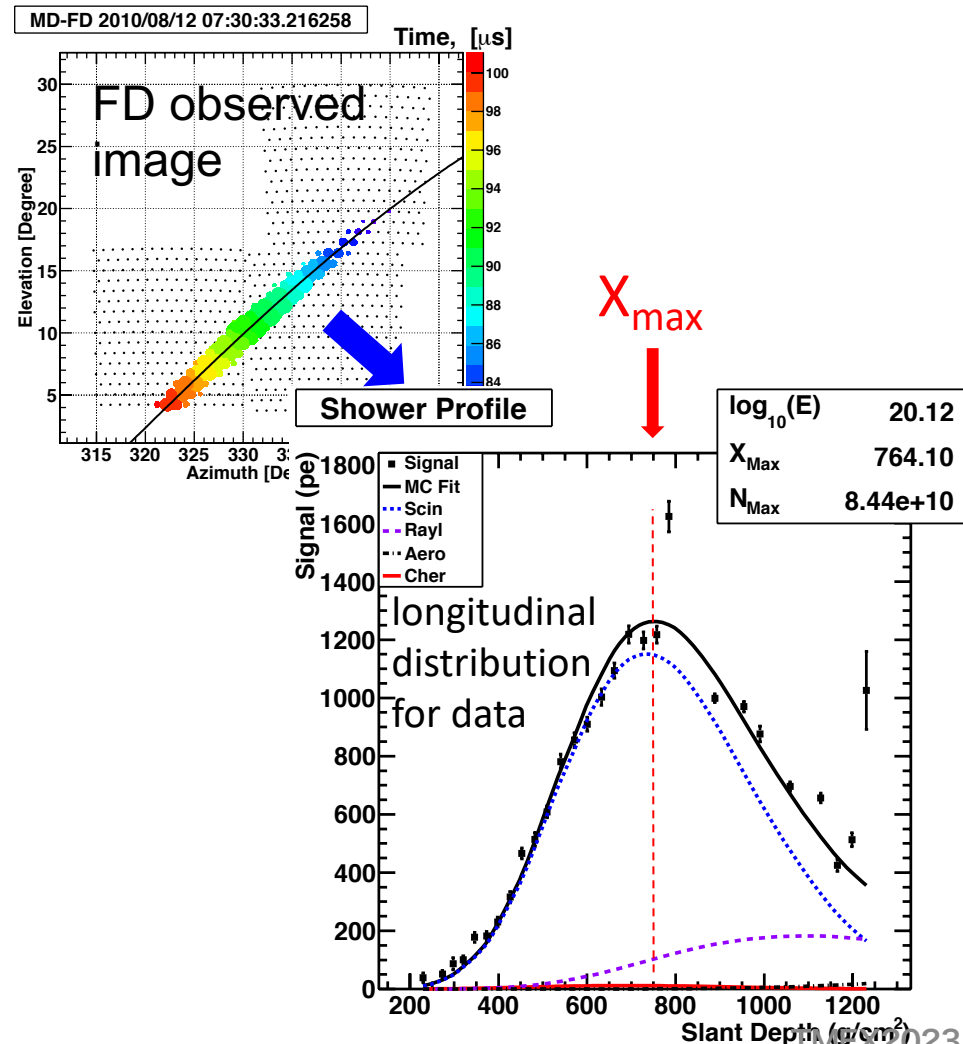

All energy range

Mass Composition

Mass composition analysis

Estimate primary cosmic ray mass composition from the depth of the air shower maximum (X_{\max})

TA Stereo measurement

stereo image

X_{max} resolution $< 25 \text{ g/cm}^2$, Energy resolution $< 7 \%$ (energy dependent)

Systematic uncertainty on X_{max} is 15 g/cm^2

Scatter plot of X_{max} vs energy.

Measured data and from QGSJET II-04 MC predictions (proton and iron)

Data support a light component at any energy

Quality cuts: Coincidence FDs within 2 ms, Downward-going, SDP angle $< 170^\circ$, track length $\geq 6^\circ$, duration $\geq 2 \mu\text{s}$, X_{max} in FOV

TA Hybrid measurement

10yrs TA-Hybrid data $10^{18.2}$ to $10^{19.1}$ eV
3560 events after the quality cuts

X_{\max} bias < 1 g/cm²

X_{\max} resolution = 17.2 g/cm²

Energy resolution = 5.7 %

Systematic uncertainty is 17 g/cm²

$\langle X_{\max} \rangle$ along with predictions of QGSJETII-04 proton, helium, nitrogen, iron

X_{\max} dist. width ($\sigma_{X_{\max}}$) along with predictions of QGSJETII-04 proton, helium, nitrogen, iron

TA data are compatible with the light component below 10^{19} eV

Quality Cuts:

$D_{\text{border}} > 100\text{m}$, tracklength $> 10^\circ$, # of PMT > 11

SDP angle $< 130^\circ$, duration $> 7\mu\text{s}$, zenith angle $< 55^\circ$

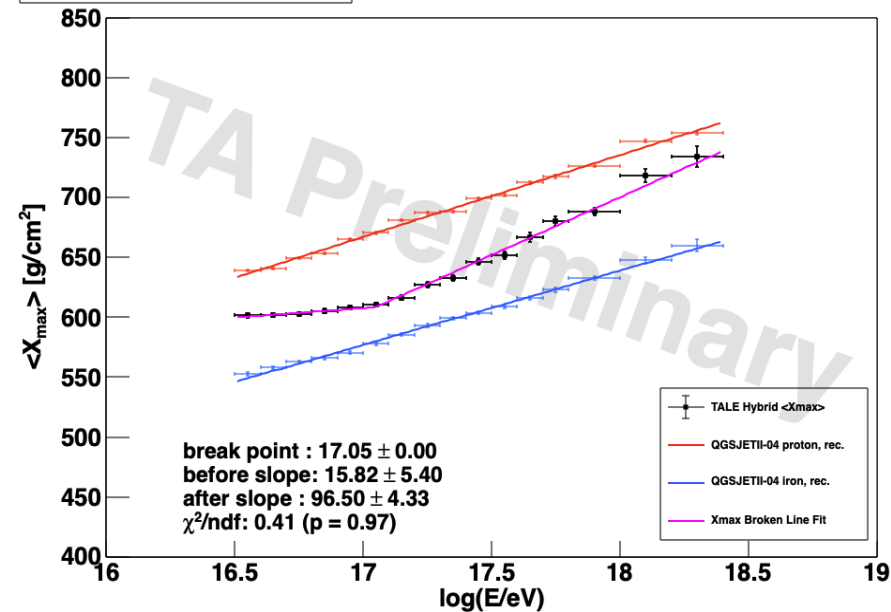

X_{\max} in F.O.V, good weather

TALE Hybrid X_{\max} measurement

- Measured reconstructed $\langle X_{\max} \rangle / \sigma(X_{\max})$ vs. energy
 - Nov. 2017 - May. 2022 (4 yrs, 1880 hours)

$\langle X_{\max} \rangle$ vs. $\log_{10}(E/eV)$

$\sigma(X_{\max})$ plot

$$D_{10}^{\text{before}} = 16 \pm 5 \text{ g/cm}^2/\text{decade}$$

$$D_{10}^{\text{after}} = 97 \pm 4 \text{ g/cm}^2/\text{decade}$$

$$\log_{10}(E_{\text{break}}/eV) = 17.1$$

MC elongation rate [g/cm²/decade]

	proton	iron
D_{10}^{MC}	68 ± 2	62 ± 2

Suggest light to heavy below 10^{17} eV, then getting lighter above

TALE Hybrid X_{\max} measurement

- Measured reconstructed $\langle X_{\max} \rangle / \sigma(X_{\max})$ vs. energy
- Nov. 2017 - May. 2022 (4 yrs, 1880 hours)

$\langle X_{\max} \rangle$ vs. $\log_{10}(E/eV)$

$\langle \ln A \rangle$ vs $\log(E/eV)$

$D_{10}^{\text{before}} = 16 \pm 5 \text{ g/cm}^2/\text{decade}$
 $D_{10}^{\text{after}} = 97 \pm 4 \text{ g/cm}^2/\text{decade}$
 $\log_{10}(E_{\text{break}}/eV) = 17.1$

MC elongation rate [g/cm²/decade]

	proton	iron
D_{10}^{MC}	68 ± 2	62 ± 2

Suggest light to heavy below 10^{17} eV, then getting lighter above

Anisotropy

Anisotropy, in higher energy ($E > 57 \text{ EeV}$)

Search for Intermediate-scale anisotropy
in the UHECR arrival directions

Original hotspot reported in 2014, from 5 years of data
Ap. J., 790, L21 (2014)

$E > 57 \text{ EeV}$ (Observed 72 events)

20° over-sampling circle

19 events fall in “Hotspot” centered at $(146.7^\circ, 43.2^\circ)$

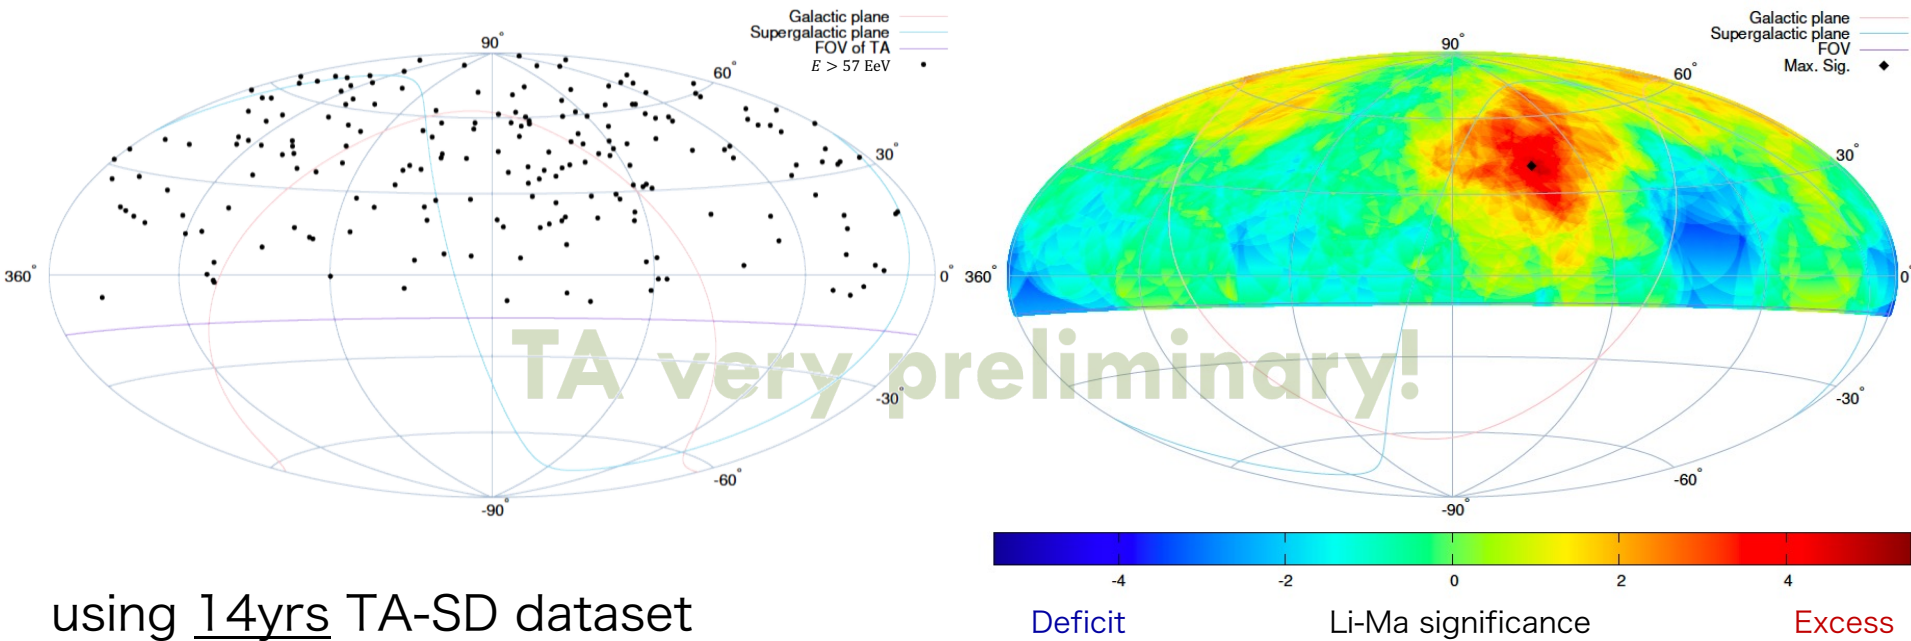

(Expected = 4.5 events) local significance 5.1σ

post trial significance 3.4σ

Anisotropy, in higher energy ($E > 57 \text{ EeV}$)

Search for Intermediate-scale anisotropy in the UHECR arrival directions

TA very preliminary!

using 14yrs TA-SD dataset

$E > 57 \text{ EeV}$, in total 205 events

44 events fall in Hotspot ($\alpha = 144.0^\circ$, $\delta = 40.5^\circ$, 25° radius, 22° from SGP)

expected = 16.9 events

local significance: 5.1σ , chance probability: 3.2×10^{-6}

25° over-sampling radius shows the highest local significance

(scanned 15° to 35° with 5° step)

New excess of events with $E \geq 10^{19.4}$ eV

Deficit

Li-Ma significance

Excess

- 1060 events with $E \geq 10^{19.4}$ eV (14yrs TA SD data)

- Maximum local significance: 3.8σ at $(17.4^\circ, 36.0^\circ)$

Observed: 95 events

Expected from isotropy: 61 events

- post trial : 3.1σ

New excess of events with $E \geq 10^{19.4}$ eV

Deficit

Li-Ma significance

Excess

Compare new excess with the major structures within 150 Mpc

- Virgo cluster (17 Mpc)
- PPSC (70 Mpc)
- Coma supercluster (90 Mpc)
- Leo supercluster (135 Mpc)
- Hercules supercluster (135 Mpc)

Result indicates that a CRs source may exist in the direction of PPSC

Large scale anisotropy

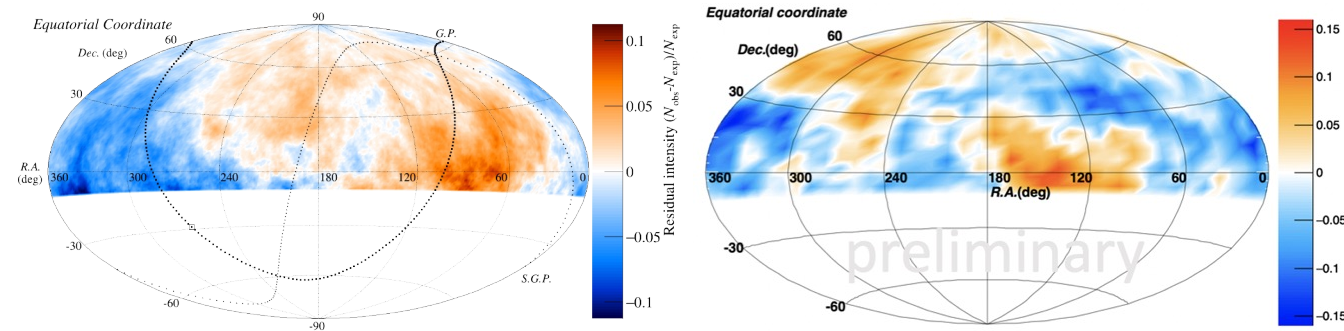

- Dipole anisotropy search with SD data
 - 11yrs TA SD and 2yrs TALE SD

Residual intensity sky-map with 45-degrees oversampling

TA SD 11years data
6032 events observed
above 8.8 EeV

TALE SD 2years data
1122 events observed
in $1 \text{ EeV} < E < 3 \text{ EeV}$

ApJL, 898, L28 (2020)

$E > 8.8 \text{ EeV}$

- Consistent with both isotropic and Auger reported dipole

$1 \text{ EeV} < E < 3 \text{ EeV}$

- Consistent with isotropic

Need more statistics

Recent progress of extension project

Future prospect

- Farther low energy extension with **Hybrid** mode
 - 50 SDs with 100m spacing
- Target energy: $E > 10^{15}$ eV
- SD production on Oct. 2021
 - same design as TA/TALE SD

- plan to start data taking on 2023
- MC study is ongoing also

TALE Hybrid Spectrum with recent measurements

<ln A> vs log E

Summary

Telescope Array is UHECR observatory in the northern hemisphere

Spectrum

- 5 orders of spectrum are observed
- new feature above ankle

Mass composition

- heavy to light above 2nd knee
- Compatible with a light component in higher energies

Anisotropy search

- new excess above $10^{19.4}$ eV
- PPSC is behind

We need much more data at highest energy

-> TAx4 is in operation!
