Primordial Black Holes

- Motivations
 - Remove unwanted monopoles or domain walls
 - Seeds for SMBHs or LSS
 - Dark matter?

- Motivations
 - Remove unwanted monopoles or domain walls
 - Seeds for SMBHs or LSS
 - Dark matter?
- Production mechanisms
 - Density perturbations generated during inflation
 - Topological defects
 - Scalar condensates
 - First order cosmological phase transition

Mapping the Northern Sky in High-Energy Gamma Rays

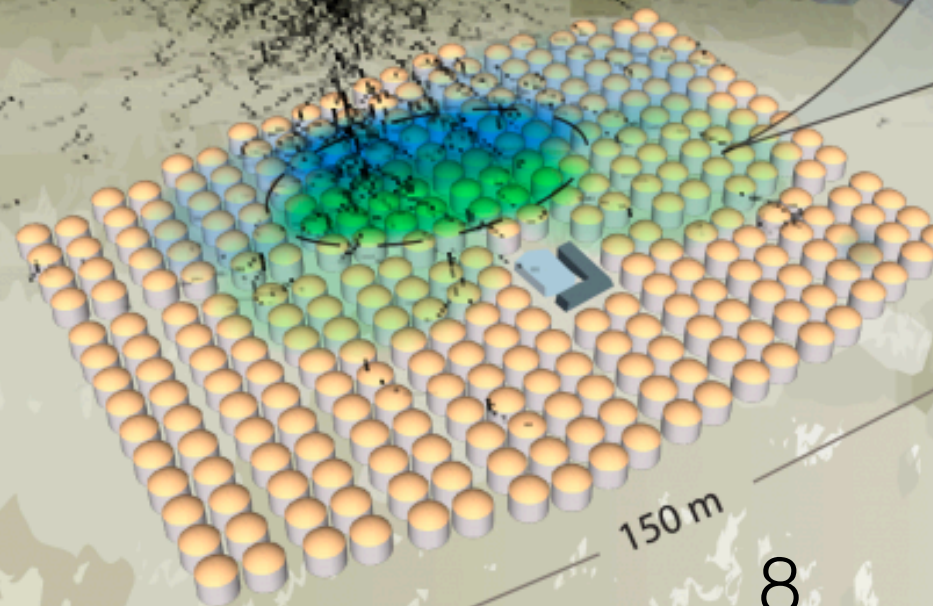

HAWC Observatory

HAWC operates day and night, providing a large field of view for the observation of the highest energy gamma rays.

Pico de Orizaba (5,626 m)

HAWC is located at 4,100 m above sea level, covering an area of 20,000 m².

Water Cherenkov tank

HAWC comprises an array of 300 tanks that record the particles created in gamma-ray and cosmic-ray showers.

Particles inside the shower produce Cherenkov radiation that is detected by the PMTs.

Gamma rays vs cosmic rays

HAWC selects gamma rays from among a much more abundant background of cosmic rays.

gamma-ray shower

cosmic-ray shower

- So,

- So,
 - There could be black holes which are evaporating today

- So,
 - There could be black holes which are evaporating today
 - As the black hole shrinks, it heats up (finally reaching $T \sim M_{\text{Pl}}$)

- So,
 - There could be black holes which are evaporating today
 - As the black hole shrinks, it heats up (finally reaching $T \sim M_{\text{Pl}}$)
 - The black hole radiates all fundamental d.o.f. (SM and BSM) lighter than T

- So,
 - There could be black holes which are evaporating today
 - As the black hole shrinks, it heats up (finally reaching $T \sim M_{\text{Pl}}$)
 - The black hole radiates all fundamental d.o.f. (SM and BSM) lighter than T
 - Experiments are currently looking for their final explosion

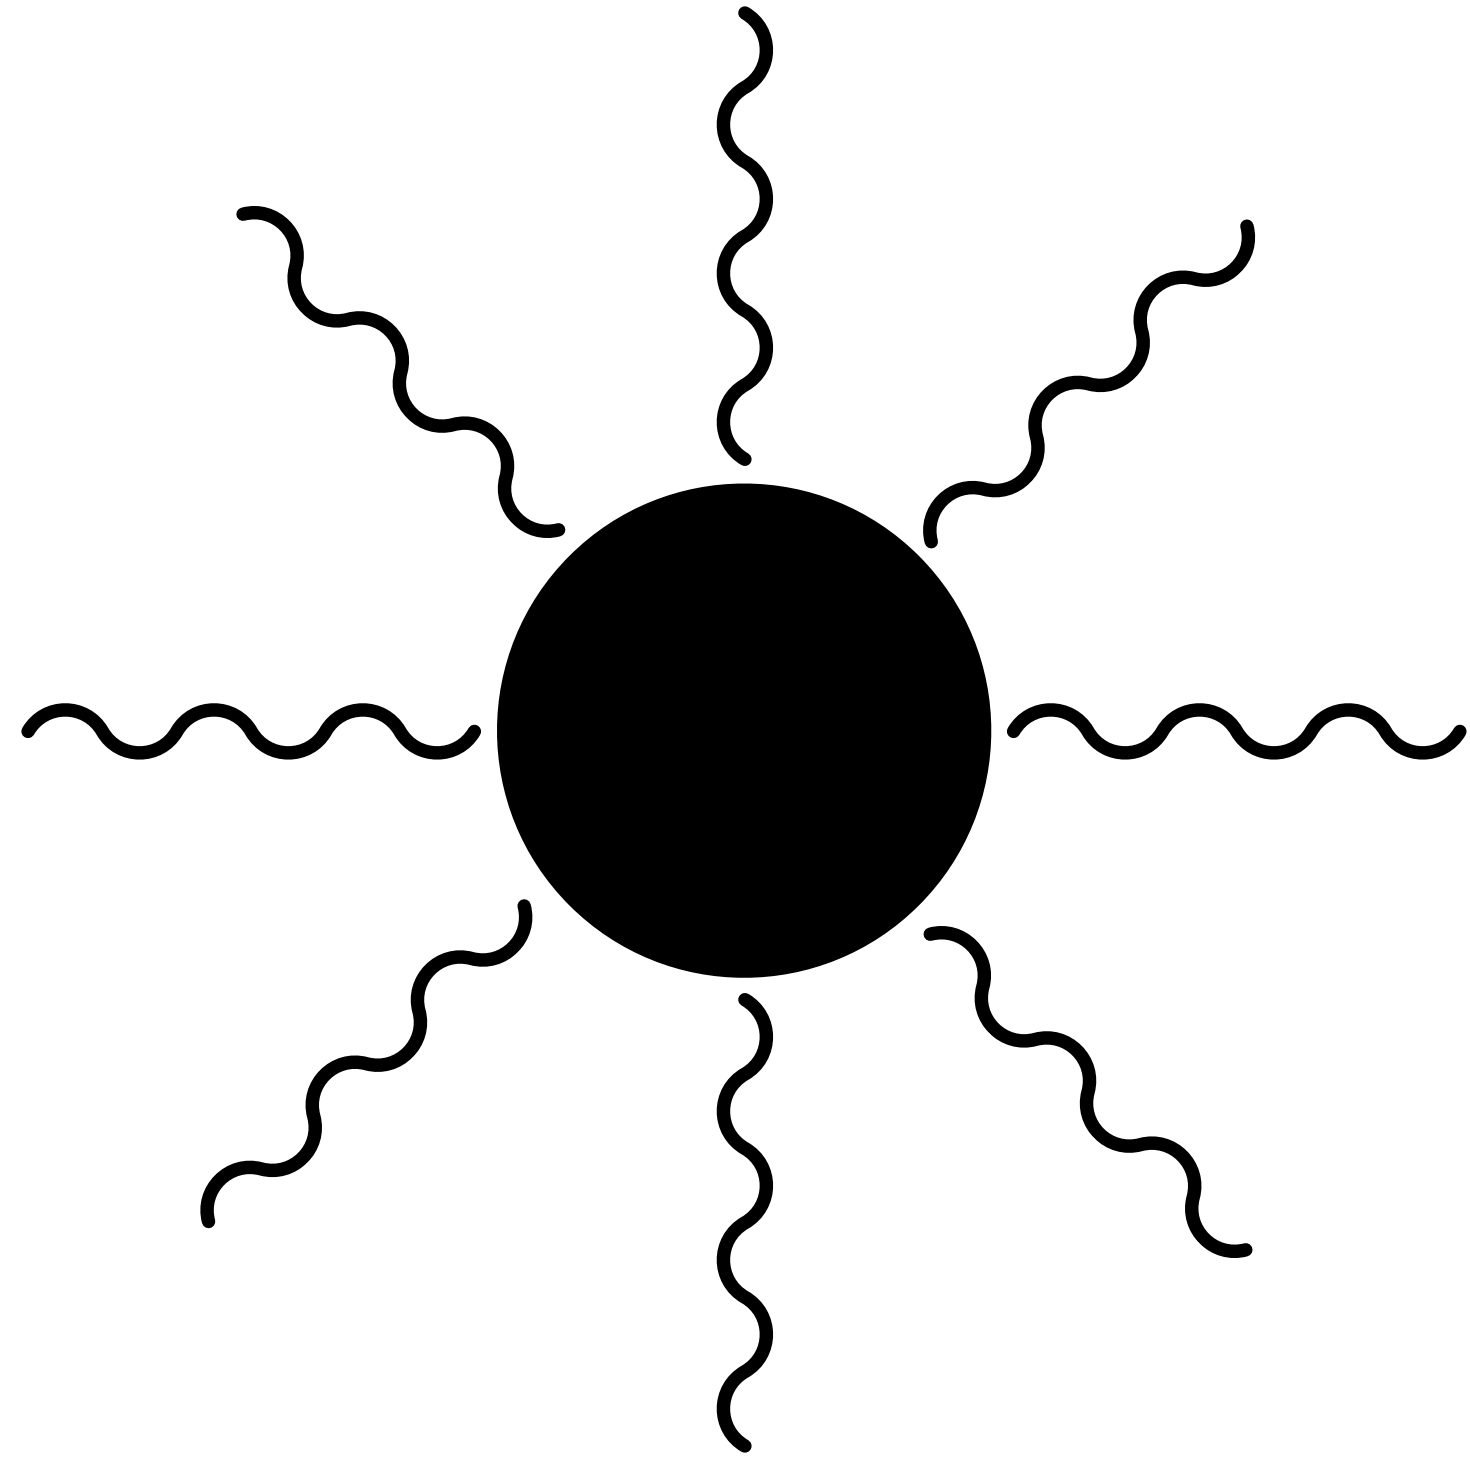

- So,
 - There could be black holes which are evaporating today
 - As the black hole shrinks, it heats up (finally reaching $T \sim M_{\text{Pl}}$)
 - The black hole radiates all fundamental d.o.f. (SM and BSM) lighter than T
 - Experiments are currently looking for their final explosion

- We ask the question:

- So,
 - There could be black holes which are evaporating today
 - As the black hole shrinks, it heats up (finally reaching $T \sim M_{\text{Pl}}$)
 - The black hole radiates all fundamental d.o.f. (SM and BSM) lighter than T
 - Experiments are currently looking for their final explosion

- We ask the question:
 - What could we learn about BSM physics if an evaporating black hole were observed today?

- Introduction
- Black Hole Evaporation
 - Standard Model
 - Beyond the Standard Model
- Conclusions

- Evaporating Black Holes could potentially be observed in the near future

- Evaporating Black Holes could potentially be observed in the near future
- They would give us unprecedented information on BSM physics, and give definitive information on the particle spectrum of nature

- Evaporating Black Holes could potentially be observed in the near future
- They would give us unprecedented information on BSM physics, and give definitive information on the particle spectrum of nature
- More work to be done to see if it's reasonable to hope for an observation

- Evaporating Black Holes could potentially be observed in the near future
